FRANCE

AGRICULTURE

Archbishoprics, Bishops.
Reims - Soissons, Châlons-sur-Marne, Beauvais, Amiens.
Rennes - Quimper, Vannes, St. Briec.
Rouen - Bayeux, Evreux, Sées, Coutances.
Sens - Troyes, Nevers, Moulins.
Toulouse - Montauban, the Paries, Carcassonne.
Tours - Le Mans, Angers, Nantes, Laval.

The dioceses are divided into parishes each under a parish priest known as a curé or deservant (incumbent). The bishops and archbishops, formerly nominated by the government and canonically confirmed by the pope, are now chosen by the latter. The appointment of curés rested with the bishops and had to be confirmed by the government, but this confirmation is now dispensed with. The archbishops used to receive an annual salary of £600 each and the bishops £400.

The archbishops and bishops are assisted by vicars-general (at salaries previously ranging from £300 to £800) and to each cathedral is attached a chapter of canons. A curé, in addition to his regular salary, receives fees for baptisms, marriages, funerals and special masses, and had the benefit of a free house called a presbytère.

The total personnel of state-paid Roman Catholic clergy amounted in 1903 to 36,109. The Roman priests are drawn from the seminaries, established by the church for the education of young men intending to join its ranks, and divided into lower and higher seminaries (grandes et petits séminaires), the latter giving the same class of instruction as the former.

The Protestant may be estimated at about 600,000 and the Jews at about 70,000. The greatest number of Jews is to be found at Paris, Lyons and Bordeaux, while the departments of the centre and of the south along the river Loire, where Catholicism is strong, are also important centres. Protestantism is also well represented in the latter, and the most important centre is Tours.

Considerable sprinklings of French in the two Charentes, in Dauphiné, in Paris and in Franche-Comté. The two Protestant bodies used to cost the state about £50,000 a year and the Jewish Church about £60,000.

Both Protestant churches have a parochial organization and a presbyterian form of church government. In the Reformed Church (far as maintained by the two bodies) each parish is a council of presbyters, consisting of the pastor and lay members elected by the congregation. Several parishes form a consistorial circuit, which has a consistorial council consisting of the council of presbyters of the church of the consistory, the pastor and one delegate of the presbyters from each parish and other elected members. There are 103 consistorial circuits (including Algeria), which are grouped into 21 provincial synods, composed of a pastor and lay delegate from each consistory. The more important questions of church discipline relating to the doctrine and practice of the church are dealt with by the synods. At the head of the whole organization is a General Synod, sitting at Paris. The organization of the Lutheran Church (Église de la confession d'Augsburg) is broader.

The Jewish parishes, called synagogue, are grouped into departmental consistories (Paris, Bordeaux, Nancy, Marseilles, Bayonne, Lille, Vesoul, Besançon and three in Algeria). Each synagogue is served by a permanent executive commission.

The Jewish priests, called rabbis, are grouped into departmental consistories (Paris, Bordeaux, Nancy, Marseilles, Bayonne, Lille, Vesoul, Besançon and three in Algeria). Each synagogue is served by a permanent executive commission and in each synagogue is a rabbi. At Paris is the central consistory, controlled by the government and presided over by the supreme grand rabbi.

Agriculture.

Of the population of France some 17,000,000 depend upon agriculture for their livelihood, though only about 6,500,000 are engaged in work on the land. The cultivable land of the country occupies some 195,000 sq. m. or about 94% of the total area; of this 171,000 sq. m. are cultivated. There are besides 12,300 sq. m. of uncultivated arable land covered by lakes, rivers, towns, &c. Only the roughest estimate is possible as to the

Forage Crops.—The mangold-wurzel, occupying four times the acreage of swedes and turnips, is by far the chief root crop in France. It is grown largely in the departments of Nord and Pas-de-Calais and in those of the Seine basin, the southern limit of its cultivation being roughly a line drawn from Bordeaux to Lyons. The average area occupied by it in the years from 1896 to 1905 was 12,043,000 acres, the total average production being 262,364,000 cwt. and the average production per acre 19 tons. Clover, lucerne and sainfoin occupy the bulk of artificial pasturage, while vetches, crimson clover and cabbages are the other chief forage crops.

Vegtables.—Potatoes are not a special product of any region, though grown in great quantities in the Bresse and the Vosges. Early potatoes, or other vegetables (primroses) are largely cultivated in the districts bordering the English Channel. Market-gardening is an important industry in the regions around Paris, Amiens and Angers, as it is round Toulouse, Montauban, Avignon and in southern France. Many gardeners in Paris and its vicinity have a high reputation for skill in the forcing of early vegetables under glass.

Industrial Plants.—The manufacture of sugar from beetroot, owing to the increased use of sugar, became highly important during

1 Inspectors are placed at the head of the synodal circuits; their functions are to consecrate candidates for the ministry, install the pastors, &c.

2 Cultures industrielles—Under this head the French group beetroot, hemp, flax and other plants, the products of which pass through some process of manufacture before they reach the consumer.
the latter half of the 19th century, the industry both of cultivation and manufacture being centered in the northern departments of Aisne, Nord, Pas-de-Calais, Somme and Oise, the first named supplying nearly a quarter of the whole amount produced in France. Flax and hemp showed a decreasing acreage from 1881 onwards. Flax is cultivated chiefly in the northern departments of Nord, Seine-Inférieure, Pas-de-Calais, Côtes-du-Nord, hemp in Sarthe, Morbihan and Maine-et-Loire.

Cash crops grow in the lower basin of the Seine (Seine-Inférieure and Eure), is the most important of the oil-producing plants, all of which show a diminishing acreage. The three principal regions for production of tobacco are the basin of the Garonne (Lot-et-Garonne, Dordogne, Lot and Gironde), the basin of the Isère (Isère and Savoie) and the department of Pas-de-Calais. The state controls its cultivation, which is allowed only in a limited number of departments. Hops cover only about 7000 acres, being almost confined to the departments of Nord, Côte d'Or and Meurthe-et-Moselle.

Vineyards. —The vine grows generally in France, except in the extreme north and in Normandy and Brittany. The great wine-producing regions are:

1. The country fringing the Mediterranean coast and including Hérault (240,822,000 gals. in 1905), and Aude (171,493,000 gals. in 1905), the most productive departments in France in this respect.
2. The department of Gironde (93,559,000 gals. in 1905), whence come Médoc and the other wines for which Bordeaux is the market.
3. The lower valley of the Loire, including Touraine and Anjou, and the district of Sologne.
4. The valley of the Rhône.
5. The Burgundian region, including Côte d'Or and the valley of the Saône (Beaujolais, Mâconnais).
6. The Champagne.
7. The Charente region, the grapes of which furnish brandy, as do those of Armagnac (department of Gers).

The decennial averages for the years 1896-1905 were as follows:

<table>
<thead>
<tr>

Fruits. —Fruit-growing is general all over France, which, apart from bananas and pine-apples, produces in the open air all the ordinary species of fruit which its inhabitants consume. Some of these may be grown in vineyards. The cider apple, which ranks first in importance, is produced in those districts where cider is the habitual drink, that is to say, chiefly in the region north-west of a line drawn from the mouth of the Loire to the mouth of the Rhône. The average annual production of cider during the years 1896 to 1905 was 364,884,000 gallons. Dessert apples are grown there and in the valley of the Loire on both banks of the lower Loire, the valley of which abounds in orchards and wherein many varieties of fruit flourish, and in nursery-gardens. The hilly regions of Limousin, Périgord and the Cévennes are the home of the chestnut, which in some places is still a staple food; walnuts grow on the lower levels of the central plateau and in lower Dauphiné and Provence, figs and almonds in Provencal argences and citrons on the Mediterranean coast, apricots in central France, the olive in Provence and the lower valleys of the Rhône and Durance. Truffles are found under the oaks of Périgord, Comtat-Venassin and lower Dauphiné. The mulberries grow in the valleys of the Rhône and its tributaries, the Isère, the Drôme, the Ardèche, the Gard and the Durance, and also along the coast of the Mediterranean. Silk-worm rearing, which is encouraged by state grants, is carried on in the valleys mentioned and on the Mediterranean coast east of Marseilles. The numbers of growers decreased from 139,000 in 1891 to 124,000 in 1905. The decrease in the annual average production of cocoons is shown in the preceding table.

Snails are reared in some parts of the country as an article of food, those of Burgundy being specially esteemed.

Organizational Agriculture. —In France the interests of agriculture are entrusted to a special ministry, comprising the following divisions: (1) forests, (2) breeding-stud (haras); (3) agriculture, a department which supervises agricultural instruction and the distribution of state moneys, so-called agriculture customs; (3) draining, irrigation, &c.; (4) an intelligence department which prepares statistics, issues information as to prices and markets, &c. The minister is assisted by a superior council of agriculture, the members of which are appointed for four years, one-fourth being renewed each year, and are elected by the municipal council which consists of deputes and prominent agriculturists. The ministry employs inspectors, whose duty it is to visit the different parts of the country and to report on their respective positions and wants. The reports which the ministers furnish help to determine the distribution of the moneys dispensed by the state in the form of subsidies to agricultural

1 The chief breeds of horses are the Boulonnais (heavy draught), the Percheron (light and heavy draught), the Anglo-Norman (light draught and heavy cavalry) and the Tarbais of the western Pyrenees (saddle horses and light cavalry). Of cattle besides the breeds named the Norman (beef and milk), the Limousin (beef), the Montbéliard, the Bazadais, the Flamand, the Breton and the Pathénaud breeds may be mentioned.
FRANCE

whether run by steam, water-power or other motive forces, has played a great part in the promotion of industry; the increase in the amount of steam-horse-power employed in industrial establishments is, to a certain degree, an index to the activity of the country as regards manufactures.

The appended table shows the progress made since 1850 with regard to steam power. Railway and marine locomotives are not included.

<table>

With the exception of Loire, Bouches-du-Rhône and Rhône, the chief industrial departments of France are to be found in the north and north-east of the country. In 1851 and 1861 those in which the working inhabitants of both sexes were engaged in industry as opposed to agriculture to the extent of 50% (approximately) or over, numbered eleven, viz.:

1 The department is also entrusted with surveillance over river-fishing, pisciculture and the amelioration of pasture.

The Alps and Pyrenees are in large part deforested, but reforestation with a view to minimizing the effects of avalanches and sudden floods is continually in progress.

Of the total area of approximately one-third belongs to the state, communes and public institutions. The rest belongs to private owners who are, however, subject to certain restrictions.

The Department of Waters and Forests (Administration des Eaux et Forêts) forms a branch of the ministry of agriculture. It is administered by a director-general, who has his headquarters at Paris, assisted by three administrators who are charged with the working of the forests, questions of rights and law, finance and planning work. The establishment consists of 32 conservators, each at the head of a district comprising one or more departments, 200 inspectors, 215 sub-inspectors, about 300 garde généraux. These officials form the higher grade of the service (agents). There are besides several thousand forest-rangers and other employees (préposés). The department is supplied with officials of the higher class from the National School of Waters and Forests at Nancy, founded in 1824.

spinning and weaving. The typically industrial region of France is the department of Nord, the seat of the woolen industry, but also prominently concerned in other textile industries, in metal working, and in a variety of other manufactures, fuel for which is supplied by its coal-fields. The following sketch of the manufacturing industry of France takes account chiefly of those of its branches which are capable in some degree of localization. Many of the great industries of the country, e.g., tanning, brick-making, the manufacture of garments, &c., are evenly distributed throughout it, and are to be found in or near all larger centres of population.

Coal.—The principal mines of France are coal and iron mines. The production of coal and lignite averaging 33,650,000 metric tons in the years 1901–1905 represents about 73 % of the total consumption of the country; the surplus is supplied from Great Britain, Belgium and Germany. The preceding table shows the average output of the chief coal-groups for the years 1901–1905 inclusive. The Flemish coal-basin, employing over 100,000 hands, produces 60 % of the coal mines of France.

French lignite comes for the most part from the department of Bouches-du-Rhône (near Fuveau). The development of French coal and lignite mining in the 19th century, together with records of prices, which rose considerably at the end of the period, is set forth in the table below:

Iron.—The iron-mines of France are more numerous than its coal-mines, but they do not yield a sufficient quantity of ore for the needs of the metallurgical industries of the country; as will be seen in the table below, the production of iron in France gradually increased during the 19th century; on the other hand, a decline in prices operated against a correspondingly marked increase in its annual value.

The department of Meurthe-et-Moselle (basins of Nancy and Longwy-Briey) furnished 84 % of the total output during the quinquennial period 1901–1905, may be reckoned as one of the principal iron-producing regions of the world. The other chief producers were Pyrénées-Orientales, Calvados, Haute-Marne (Vassy) and Saône-et-Loire (Mâcon and Châlon).

Other Ores.—The mining of zinc, the chief depositories of which are at Malines (Gard), Les Borromées (Var) and Planièges (Lot), and of lead, produced especially at Chalais (Ardèche), ranks next in importance to that of iron. Iron-ore is almost entirely from Sain-Bel (Rhône), manganese chiefly from Ariège and Saône-et-Loire, antimony from the departments of Mayenne, Haute-Loire and Cantal. Copper and mispickel are mined only in small quantities.

The table below gives the average production of zinc, argentiferous lead, iron-pyrites and other ores during the quinquennial period 1901–1905:

<table>
<thead>
<tr>
<th>Zinc</th>

</tr>
</tbody>
</table>

Salt, &c.—Rock-salt is worked chiefly in the department of Meurthe-et-Moselle, which produces more than half the average annual product of salt. For the years 1896–1905 this was 1,090,000 tons, including both rock- and sea-salt. The salt-marches of the Mediterranean coast, especially the Etang de Berre and those of Lorraine (Loire), are the principal sources of sea-salt. Sulphur is obtained near Apt (Vaucluse) and in a few other localities of south-eastern France; bismuthiferous schist near Autun (Saône-et-Loire) and Buxières (Allier). The most extensive salt-works are in the valleys of the Somme; asphalt comes from Seyssel (Ain) and Puy-de-Dôme.

The mineral springs of France are numerous, of varied character and much frequented. Leading resorts are: in the Pyrenean region, Amélie-les-Bains, Bagneres-de-Luchon, Bagneres-de-Bigorre, Barèges, Cauterets, Eaux-Bonnes, Eaux-Chaudes and Dax; in the Centre, Plateau, Mont-Dore, La Bourboule, Bourbon l’Archambault, Vichy, Royat, Chaudes-Aigues, Vals, Lamalou; in the Alps, Aix-les-Bains and Evian; in the Vosges and Fauciennes, Plombières, Luxeuil, Conflévrifie, Vittel, Martigny and Bourbonne-les-Bains. Outside these main groups St Amant-les-Eaux and Foyes-les-Eaux may be mentioned.

Quartz-Products.—Quarries of various descriptions are numerous all over France. Slate is obtained in large quantities from the departments of Maine-et-Loire (Angers), Ardennes (Fumay) and Mayenne (Ranazé). Stone-quarrying is specially active in the departments round Paris, Seine-et-Oise employing more persons in this occupation than any other department. The environs of Creil (Oise) and Chateau-Landon (Seine-et-Oise) are noted for their stone (pierre de taille), which is also abundant at Evuville et Lourouville in Meuse; the production of plaster is particularly important in the environs of Paris, of kaolin of fine quality at Yrieix (Haute-Vienne), of hydraulic lime in Ardèche (Le Tell), of lime phosphates in the departments of Somme, of marble in the departments of Haute-Garonne (St Béat), Hautes-Pyrénées (Campan, Sarraucolin), Isère and Pas-de-Calais, and of cement in Pas-de-Calais (vicinity of Boulogne) and Isère (Grenoble). Paving-stone is supplied in large quantities by Seine-et-Oise, and brick-clay is worked chiefly in Nord, Seine and Pas-de-Calais. The products of the quarries of the five years 1901–1905 averaged 59,311,000 per annum in value, of which building material brought in over two-thirds.

Metalurgy.—The average production and value of iron and steel manufactured in France in the last four decades of the 19th century is shown below:

<table>
<thead>
<tr>
<th>Years</th>
<th>Cast Iron</th>
<th>Wrought Iron and Steel.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1861–1870</td>
<td>119,5</td>
<td>5,012</td>

1 The metric ton = 1000 kilogrammes or 2204 lb.
Rhône (Lyons), Saône-et-Loire (Le Creusot, Chalon-sur-Saône) and Loire-Inférieure (Basse-Indre, Indret, Coulon, Trignac) also play a considerable part in this industry.

The chief centres for the manufacture of cutlery are Châlons-sur-Marne, Vichy, Tarare, and Beaune; for that of arms St Etienne, Tulle et Châtellerault; for that of watches and clocks, Besançon (Doubs) and Monthélie (Doubs); for that of optical and mathematical instruments Paris, Muret (Ariège) and Le Creusot; and for that of locksmiths' ware the region of Vienne (Pas-de-Calais).

There are important zinc works at Auby and St Amand (Nord) and Viviez (Aveyron) and Noyelles-Godault (Pas-de-Calais); there are large salt works at the latter place, and others of importance at Coulon (Loire-Inférieure). Copper is smelted in Ardennes and Pas-de-Calais. The production of these metals, which are far the most important after iron and steel, increased steadily during the period 1890-1908, and reached its highest point in 1908, details for which year are given below:

<table>
<thead>

Wool.—In 1901, 161,000 persons were engaged in the spinning and dyeing industries, and the weaving of woollen goods. The woollen industry is carried on extensively in the department of Nord (Roubaix, Tourcoing, Fourmies). Of second rank are Reims and Sedan in the Champagne group; Elbeuf, Louviers and Rouen in Normandy; Lagny-le-Château (Marne) and Maizières.

Cotton.—In 1901, 166,000 persons were employed in the spinning and weaving of cotton, French cotton goods being distinguished chiefly for the originality of their design. The cotton industry is districted according to the larger cities and towns. The largest established is that of Normandy, having centres at Rouen, Herve, Eyvres, Falaise and Flers. Another group in the north of France has its centres at Lille, Tourcoing, Roubaix, St Quentin and Amiens. That of the Vosges is an extension since the latter part of the 19th century, and is largely centred at Lons-le-Saunier, comprising Épinal, St-Dié, Remiremont and Belfort. Other groups of less importance are situated in the departments of the Meuse, Meurthe-et-Moselle and Vosges.

Silk.—The silk industry occupied 134,000 hands in 1901. The silk factories of France, 3,200 in number, are distributed over the whole of the country, with the exception of certain districts, particularly the eastern provinces.

Hemp, Jute, &c.—The preparation and spinning of these materials and the manufacture of nets and rope, together with the weaving of linen and other fabrics, give occupation to 112,000 persons chiefly in the departments of Nord (Lille, Armentières, Dunkirk), Somme (Amiens) and Maine-et-Loire (Angers, Cholet).

Leather.—The manufacture of leather is carried on extensively by 55,000 persons, chief centre in Aube (Troyes). The production of lace and guipure, occupying 112,000 persons, is carried on mainly in the towns and villages of the Haute-Loire and in the Vosges (Mirecourt), Rhône (Lyon), Pas-de-Calais (Calais) and Paris.

Sugar.—The manufacture of sugar is carried on in the departments of Nord and Pas-de-Calais, on the coast and in the department of Meuse (Bar-le-Duc). There are also small sugar refineries in the departments of Aisne, Oise and Marne.

Alcohol.—The distillation of alcohol is in the hands of three classes of persons: (1) private distillers (bouilleurs et distillateurs de profession); (2) small private distillers, not under state control; (3) large private distillers, under state control, giving notice to the state that they distil. The last two classes are the largest and are engaged in the manufacture of spirits for general consumption, being 13,117,000 gallons, or about 26% of the total production of France during the same period (49,945,000 gallons). Aisne, Pas-de-Calais and Somme rank next to Nord.

Glass is manufactured in the departments of Nord (Aniche, &c.), Seine, Loire (Rive-de-Lèvre) and Meurthe-et-Moselle, Baccarat in the latter department being famous for its table-glass. Limoges is the chief centre for the manufacture of porcelain, and the artistic products of the national porcelain factory of Sévres have a worldwide reputation.

The manufacture of paper and cardboard is largely carried on in Charente (Angoulême), that of oil, cheese and soap has its chief centre at Marseille. Brewing and malting are localized chiefly in the Nord.

In the south of France, the towns of Aix-en-Provence, Nice, Cannes and Antibes are well-known centres of manufacture.

Occupations.—The following table, which shows the approximate numbers of persons engaged in the various manufacturing industries of France, which number in all about 5,820,000, indicates their relative importance from the point of view of employment:

<table>

Some 9000 individuals were engaged in unclassified industries.

Fisheries.—The fishing population of France is most numerous in the Breton departments of Finistère, Côtes-du-Nord and Morbihan and in Pas-de-Calais. Dunkirk, Gravelines, Boulogne and Palomé send considerable fleets to the Icelandic cod-fisheries, and St Malo, Fécamp, Granville and Câscais to those of Newfoundland. The Dogger Bank is frequented by numbers of French fishing-boats.

1 Includes manufactories of glue, tallow, soap, perfumery, fertilizers, soda, &c.

Railways.—The first important line in France, from Paris to Rouen, was constructed through the instrumentality of Sir Edward Blount (1809-1905), an English banker in Paris, who was afterwards for thirty years chairman of the Ouest railway. After the rejection in 1835 of the government's proposals for the construction of seven trunk lines to be worked by the state, he obtained a concession for that piece of line on the terms that the French treasury would advance one-third of the capital at 3% if he would raise the remaining two-thirds, half in France and half in England. The contract for building the railway was put in the hands of Thomas Brassey; English navies were largely employed on the work, and a number of English engine-drivers were employed when traffic was begun in 1843. A law passed in 1842 laid the foundation of the plan under which the railways have since been developed, and mapped out nine main lines, running from Paris to the frontiers and from the Mediterranean to the Rhine and to the Atlantic coast. Under it the cost of the necessary land was to be found as to one-third by the state and as to the residue locally, but this arrangement proved unworkable, and was abandoned in 1845, when it was settled that the state should provide the land and construct the earthworks and stations, the various companies which obtained concessions being left to make the permanent way, provide rolling stock and work the lines for certain periods. Construction proceeded under this law, but not with very satisfactory results, and new arrangements had to be made between 1852 and 1857, when the railways were concentrated in the hands of six great companies, the Nord, the Est, the Ouest, the Paris-Lyon-Méditerranée, the Orléans and the Midi. Each of these companies was allotted a definite sphere of influence, and was granted a concession for ninety-nine years from its date of formation, the concessions thus terminating at various dates between 1930 and 1960. In return for the privileges granted them the companies undertook the construction out of their own unaided resources of 1500 m. of subsidiary lines, but the railway expenditure of the country at this period was so large that in a few years they found it impossible to raise the capital they required. In these circumstances the state agreed to guarantee the interest on the capital, the sums it paid in this way being regarded as advances to be reimbursed in the future with interest at 4%. This measure proved successful and the projected lines were completed. But demands for more lines were constantly arising, and the existing companies, in view of their financial position, were disinclined to undertake their construction. The government therefore found itself obliged to inaugurate a system of direct subventions, not only to the old large companies, but also to new small ones, to encourage the development of branch and local lines, and local authorities were also empowered to contribute a portion of the required capital. The result came to be that many small lines were begun by companies that had not the means to complete them, and again the state had to come to the rescue. In 1878 it agreed to spend £20,000,000 in purchasing and completing a number of

1 See the Guide officiel de la navigation intérieure issued by the ministry of public works (Paris, 1903).
Commerce.

After entering on a régime of free trade in 1860 France gradually reverted towards protection; this system triumphed in the Customs Law of 1892, which imposed more or less considerable duties on imports—a law associated with the name of M. Mélèze. While raising the taxes both on agricultural products and manufactured goods, this law introduced, between France and all the powers trading with her, relations different from those in the past. It left the government free either to apply to foreign countries the general tariff or to enter into negotiations with them for the application, under certain conditions, of a minimum tariff. The policy of protection was further accentuated by raising the impost on corn from 5 to 7 francs per hecoulitre (24 buhshels). This system, however, which is opposed by a powerful party, has at various times undergone modifications. On the one hand it became necessary, in face of an inadequate harvest, to suspend in 1868 the application of the law on the import of corn. On the other hand, in order to check the decline of exports and neutralize the harmful effects of a prolonged customs war, a commercial treaty was in 1896 concluded with Switzerland, carrying with it a redaction in respect of certain articles, of the interests which had been fixed by the law of 1860. An accord was likewise in 1898 effected with Italy, which since 1866 had been in a state of economic rupture with France, and in July 1899 an accord was concluded with the United States of America. Almost all other countries, moreover, share in the benefit of the minimum tariff, and profit by the modifications it may successively undergo.

Being in the main a self-supporting country France carries on most of her trade within her own borders, and ranks below commerce, in Millions of Pounds Sterling.

1 Includes horses, mules and asses.
2 Except certain manufactures which come under the category of articles of food.
articles in the customs list; this value is estimated at the end of the year in accordance with the variations that have taken place and is applied provisionally to the following year.

Amongst imports raw materials (wool, cotton and silk, coal, oilseeds, timber, &c.) hold the first place, articles of food (cereals, wine, coffee, &c.) and manufactured goods (especially machinery) ranking next. Amongst exports manufactured goods (silk, cotton and woolen goods, fancy wares, apparel, &c.) come before raw materials and articles of food (wine and dairy products bought chiefly by England).

Divided into these classes the imports and exports (special trade) for quinquennial periods from 1886 to 1905 averaged as shown in the preceding table.

The decline both in imports and in exports of articles of food, which is the most noteworthy fact exhibited in the preceding table, was due to the almost prohibitive tax in the Customs Law of 1892, upon agricultural products.

The average value of the principal articles of import and export (special trade) over quinquennial periods following 1890 is shown in the two tables below.

Other countries importing largely into France are Russia, Algeria and British India, whose imports in each case averaged over 6,000,000 in value in the period 1901-1905; China (average value £7,000,000); and Italy (average value 6,000,000) and Japan (average value 6,000,000). The following are the principal countries receiving the exports of France (special trade), with values for the same periods.

The other chief customers of France were Switzerland and Italy, whose imports from France averaged in 1901-1905 nearly £16,000,000 and over £7,000,000 respectively. In the same period Spain received exports from France averaging £4,700,000.

The trade of France was divided between foreign countries and her colonies in the following proportions (imports and exports combined).

<table>

In the same year the other chief customers in order of importance were Tourcoing, Jemout, Ceté, St Nazaire and Avicourt.

The chief local bodies concerned with commerce and industry are the chambres de commerce and the chambers consultatives d'arts et manufactures, the members of which are elected from their own number by the traders and industrialists of a certain standing. They are established in the chief towns, and their principal function is to advise the government on measures for improving and facilitating commerce and industry within their jurisdiction. They are also BANKS AND BANKING; SAVINGS BANKS; POST AND PARCEL SERVICE. Shipping.—The following table shows the increase in tonnage of sailing and steam shipping engaged in foreign trade entered and cleared at the ports of France over quinquennial periods from 1890.

</tbody>
</table>

At the beginning of 1908 the total was 17,193 (tonnage, 1,632,467); of these 13,601 (tonnage, 81,835) were vessels of less than 20 tons, while 502 (tonnage, 1,014,506) were over 800 tons. The increase in the tonnage of sailing vessels, which in other countries tends to decline, was due to the bounties voted by parliament to its municipal sailing fleet with the view of increasing the number of skilled seamen. The prosperity of the French shipping trade is hampered by the costliness of shipbuilding and by the scarcity of outward-bound cargo. Shipping has been fostered by paying bounties for vessels constructed in France under the French flag, and by reserving the coasting trade, traffic between France and Algeria, &c., to French vessels. Despite these monopolies, three-fourths of the shipping in French ports is foreign, and France is without shipping companies comparable in importance to those of other great maritime nations. The three chief companies are the Messageries Maritimes (Marseilles and Bordeaux), the Compagnie Générale Transatlantique (Le Havre, St Nazaire and Marseilles) and the Chargeurs Réunis (Le Havre).
Government and Administration.

Central Government.—The principles upon which the French constitution is based are representative government (by two chambers), manhood suffrage, responsibility of ministers and irresponsibility of the head of the state. Alterations or modifications of the constitution can only be effected by the National Assembly, consisting of both chambers sitting together ad hoc. The legislative power resides in these two chambers—the Senate and the Chamber of Deputies; the executive is vested in the president of the republic and the ministers. The members of both chambers owe their election to universal suffrage; but the Senate is not elected directly by the people and the Chamber of Deputies is

The Chamber of Deputies, consisting of 584 members, is elected by the scrutin d’arrondissement (each elector voting for one deputy) for a term of four years, the conditions of election being as follows: Each arrondissement sends one deputy if its population does not exceed 100,000, and an additional deputy for every additional 100,000 inhabitants or fraction of that number. Every citizen of twenty-one years of age, unless subject to some legal disability, such as actual engagement in military service, bankruptcy or condemnation to certain punishments, has a vote, provided that he can prove a residence of six months’ duration in any one town or commune. A deputy must be a French citizen, not under twenty-five years old. Each candidate must make, at least five days before the elections, a declaration setting forth in what constituency he intends to stand. He may only stand for one, and all votes given for him in any other than that specified in the declaration are void. To secure election a candidate must at the first voting poll an absolute majority and a number of votes equal to one-fourth of the number of electors. If a second poll is necessary a relative majority is sufficient.

The Senate (see below, Law and Institutions) is composed of 300 members who must be French citizens at least forty years of age. They are elected by the “scrutin de liste” for a period of nine years, and one-third of the body retires every three years. The department which is to elect a senator when a vacancy occurs is settled by lot.

Both senators and deputies receive a salary of £500 per annum. No member of a family that has reigned in France is eligible for either chamber.

Bills may be proposed either by ministers (in the name of the president of the republic), or by private members, and may be initiated in either chamber, but money-bills must be submitted in the first place to the Chamber of Deputies. Every bill is first examined by a committee, a member of which is chosen to “report” on it to the chamber, after which it must go through two readings (délibérations), before it is presented to the other chamber. Either house may pass a vote of no confidence in the government, and in practice the government resigns in face of the passing of such a vote by the deputies, but not if it is passed by the Senate only. The chambers usually assemble in January each year, and the ordinary session lasts not less than five months; usually it continues till July. There is an extraordinary session from October till Christmas.

The president (see below, Law and Institutions) is elected for seven years, by a majority of votes, by the Senate and Chamber of Deputies sitting together as the National Assembly. Any French citizen may be chosen president, no fixed age being required. The only exception to this rule is that no member of a royal family which has once reigned in France can be elected. The president receives 1,200,000 francs (£48,000) a year, half as salary, half for travelling expenses and the charges incurred upon the official representative of the country. Both the chambers are summoned by the president, who has the power of dissolving the Chamber of Deputies with the assent of the Senate.

When a change of Government occurs the president chooses a prominent parliamentarian as premier and president of the council. This personage, who himself holds a portfolio, nomi

minates the other ministers, his choice being subject to the ratification of the chief of the state. The ministerial council (conseil des ministres) is presided over by the president of the republic; less formal meetings (conseils de cabinet) under the presidency of the premier, or even of some other minister, are also held.

The ministers, whether members of parliament or not, have the right to sit in both chambers and can address the house whenever they choose, though a minister may only vote in the chamber of which he happens to be a member. There are twelve ministries¹ comprising those of justice; finance; war; the interior; marine; colonies; public instruction and fine arts; foreign affairs; commerce and industry; agriculture; public works; and labour and public thrift. Individual ministers are responsible for all acts done in connexion with their own departments, and the body of ministers collectively is responsible for the general policy of the government.

The council of state (conseil d’état) is the principal council of the head of the state and his ministers, who consult it on various legislative problems, more particularly on questions of administration. It is divided for despatch of business into four sections, each of which corresponds to a group of two or three ministerial departments, and is composed of (1) 32 councillors en service ordinaire (comprising a vice-president and sectional presidents), and 19 councillors en service extraordinaire, i.e. government officials who are deputed to watch the interests of the ministerial departments to which they belong, and in matters not concerned with those departments have a merely consultative position; (2) 32 maîtres des requêtes; (3) 40 auditors.

The presidency of the council of state belongs ex officio to the minister of justice.

The theory of droit administratif lays down the principle that an agent of the government cannot be prosecuted or sued for acts relating to his administrative functions before the ordinary tribunals. Consequently there is a special system of administrative jurisdiction for the trial of le contentieux administratif or disputes in which the administration is concerned. The council of state is the highest administrative tribunal, and includes a special Section du contentieux to deal with judicial work of this nature.

Local Government.—France is divided into 86 administrative departments (including Corsica) or 87 if the Territory of Belfort, a remnant of the Haut Rhin department, be included. These departments are subdivided into 562 arrondissements, 269 cantons and 36,222 communes.

</table>

Before 1790 France was divided into thirty-three great and seven small military governments, often called provinces, which are, however, to be distinguished from the provinces formed under the feudal system. The great governments were: Alsace, Saintonge and Angoumois, Anjou, Artois, Aunis, Auvergne, Béarn and Navarre, Berry, Bourbonnais, Bourgogne (Burgundy), Bretagne (Brittany), Champagne, Dauphiné, Lorraine, Poitou, Provence, Roussillon, Touraine, and Corse. The eight small governments were: Paris, Boulogne and Boulognais, Le Havre, Sedan, Toulon, Pays Marse and Verdunnois and Saumurois.

At the head of each department is a prefect, a political official nominated by the minister of the interior and appointed by the president, who acts as general agent of the government and representative of the central authority. To aid him the prefect
has a general secretary and an advisory body (conseil de préfecture), the members of which are appointed by the president, which has jurisdiction in certain classes of disputes arising out of administration and must, in certain cases be consulted, though the prefect is not compelled to follow its advice. The prefect supervises the execution of the laws; has wide authority in regard to policing, public hygiene and relief of paupers children; has the nomination of various subordinate officials; and is in correspondence with the subordinate functionaries in his department, to whom he transmits the orders and instructions of the government. Although the management of local affairs is in the hands of the prefect his power with regard to these is checked by a deliberative body known as the general council (conseil général). This council, which consists for the most part of business and professional men, is elected by universal suffrage, each canton in the department contributing one member. The general council controls the departmental administration of the prefect, and its decisions on points of local government are usually final. It assigns its quota of taxes (contingent) to each arrondissement, authorizes the sale, purchase or exchange of departmental property, supervises the management thereof, authorizes the construction of new roads, railways or canals, and advises on matters of local interest. Political questions are rigorously excluded from its deliberations. The general council, when not sitting, is represented by a permanent delegation (commission départementale).

As the prefect in the department, so the sub-prefect in the arrondissement, and with a more limited power, is the representative of the central authority. He is assisted, and in some degree controlled, in his work by the district council (conseil d'arrondissement), to which each canton sends a member, chosen by universal suffrage. As the arrondissement has neither property nor budget, the principal business of the council is to allot to each commune its share of the direct taxes imposed on the arrondissement by the general council.

The canton is purely an administrative division, containing, on an average, about twelve communes, though some exceptional communes are big enough to contain more than one canton. It is the seat of a justice of the peace, and the electoral unit for the general council and the district council.

The communes, varying greatly in area and population, are the administrative units in France. The chief magistrate of the commune is the mayor (maire), who is (1) the agent of the central government and charged as such with the local promulgation and execution of the general laws and decrees of the country; (2) the executive head of the municipality, in which capacity he supervises the work of the commune, and acts as the representative of the corporation in general. He also acts as registrar of births, deaths and marriages, and officiates at civil marriages. Mayors are usually assisted by deputies (adjoints). In a commune of 2500 inhabitants or less there is one deputy; in more populous communes there may be more, but in no case must the number exceed twelve, except at Lyons, where as many as seventeen are allowed. Both mayors and deputy mayors are elected by and from among members of the municipal council for four years. This body consists, according to the population of the commune, of from 10 to 36 members, elected for four years on the principle of the scrutin de liste by Frenchmen who have reached the age of twenty-one years and have a six months' residence qualification.

The affairs of the commune are decided by the municipal council, and its decisions become operative after the expiration of a month, save in matters which involve interests transcending those of the commune. In such cases the prefect must approve them, and in some cases the sanction of the general council or even ratification by the president is necessary. The council also chooses communal delegates to elect senators, and draws up the list of répartiteurs, whose function is to settle how the commune's share of direct taxes shall be allotted among the taxpayers. The sub-prefect then selects from this list those whom he approves for the post. The meetings of the council are open to the public.

The ordinary judicial system of France comprises two classes of courts: (i) civil and criminal, (ii) special, including courts dealing only with purely commercial cases; in addition there are the administrative courts, including bodies, the Conseil d'État and the Conseils de Préfecture, which deal, in their judicial capacity, with cases coming under the droit administratif. Mention may also be made of the Tribunal des Conflicts, a special court whose function it is to decide which is the competent tribunal when an administration and a judicial court both claim or refuse to deal with a given case.

Taking the first class of courts, which have both civil and criminal jurisdiction, the lowest tribunal in the system is that of the juge de paix.

In each canton is a juge de paix, who in his capacity as a civil judge takes cognizance, without appeal, of disputes where the amount sought to be recovered does not exceed £12 in value. Where the amount exceeds £12 but not £24 an appeal lies from his decision to the court of first instance. In some particular cases where special promptitude or local knowledge is necessary, as disputes between hotelkeepers and travellers, and the like, he has jurisdiction (subject to appeal to the court of first instance) up to £60. He has also a criminal jurisdiction in contraventions, i.e. breaches of law punishable by a fine not exceeding 12s. or by imprisonment not exceeding five days. If the sentence be one of imprisonment of the fine exceeds 4s., appeal lies to the court of first instance. It is an important function of the juge de paix to endeavour to reconcile disputants who come before him, and no suit can be brought before the court of first instance until he has endeavoured without success to bring the parties to an agreement.

Tribunaux de première instance, also called tribunaux d'arrondissement, of which there is one in every arrondissement (with few exceptions), besides serving as courts of appeal from the juges de paix have an original jurisdiction in matters civil and criminal. The court consists of a president, one or more vice-presidents and a variable number of judges. A procureur, or public prosecutor, is also attached to each court. In civil matters the tribunal takes cognizance of actions relating to personal property to the value of £60, and actions relating to land to the value of £60. (£2: 8s.) per annum. When it deals with matters involving larger sums an appeal lies to the courts of appeal. In penal cases its jurisdiction extends to all offences of the class known as délits—offences punishable by a more serious penalty than the "contraventions" dealt with by the juge de paix, but not entailing such heavy penalties as the code applies to crimes, with which the assize courts (see below) deal. When sentenced, it may act as a criminal court it is known as the tribunal correctionnel. Its judgments are invariably subject in these matters to appeal before the court of appeal.

There are twenty-six courts of appeal (cours d'appel), to each of which are attached from one to five departments.

FRANCE

Cour de Cassation, sitting at Paris, and consisting of a first president, three section presidents and forty-five conseillers, with a ministerial staff (parquet) consisting of a procureur-général and six advocates-general. It is divided into three sections: the Chambre des Requêtes, or court of petitions, the civil court and the criminal court. The Cour de Cassation can review the decision of any other tribunal, except administrative courts. Criminal appeals usually go straight to the criminal section, while civil appeals are generally taken before the Chambre des Requêtes, where they undergo a preliminary examination. If the demand for rehearing is refused such refusal is final; but if it is granted the case is then heard by the civil chamber, and after argument cassation (annulment) is granted or refused. The Court of Cassation does not give the ultimate decision on a case; it pronounces, not on the question of fact, but on the legal principle at issue, or the competence of the court giving the original decision. Any decision, even one of a cour d'assises, may be brought before it in the last resort, and may be cassé—annulled. If it pronounces cassation it remits the case to the hearing of a court of the same order.

Commercial courts (tribunaux de commerce) are established in all the more important commercial towns to decide as expeditiously as possible disputed points arising out of business transactions. They consist of judges, chosen, from among the leading merchants, and elected by commerçants patentés depuis cinq ans, i.e., persons who have held the licence to trade (see Finances) for five years and upwards. In the absence of a tribunal de commerce commercial cases come before the ordinary tribunal d'arrondissement.

In important industrial towns tribunals called conseils de prud'hommes are instituted to deal with disputes between employers and employees, actions arising out of contracts of apprenticeship and the like. They are composed of employers and workmen in equal numbers and are established by decree of the council of state, advised by the minister of justice. The minister of justice is notified of the necessity for a conseil de prud'hommes by the prefect, acting on the advice of the municipal council and the Chamber of Commerce or the Chamber of Arts and Manufactures. The judges are elected by employers and workmen of a certain standing. When the amount claimed exceeds £12 appeal lies to the tribunaux d'arrondissement.

Police.—Broadly, the police of France may be divided into two great branches—administrative police (la police administrative) and judicial police (la police judiciaire), the former having for its object the maintenance of order, and the latter charged with tracing out offenders, collecting the proofs, and delivering the accused to the courts charged by law with their trial and punishment. Subdivisions may be, and often are, named according to the particular duties to which they are assigned, as la police politique, la police des mœurs, la police sanitaire, &c. The officers of the judicial police comprise the juge de paix (equivalent to the English police magistrate), the maire, the commissaire de police, the gendarmerie and, in rural districts, the gares-chômes et les gares forestiers. Gardiens de la paix (sometimes called sergents de ville, gardes de ville or agents de police) are not to be confounded with the gendarmerie, being a branch of the administrative police and corresponding more or less nearly with the English equivalent "police constabulary," which the gendarmerie do not, although both perform police duty. The gendarmerie, however, differ from the agents or gardes both in uniform and in the fact that they are for the most part country patrols. The organization of the Paris police, which is typical of that in other large towns, may be outlined briefly. The central administration (administration centrale) comprises three classes of functions which together constitute the police: First, the judicial police, charged with the exercise of the functions of a general police (la police générale), with bureaux for various objects, such as the safety of the president of the republic, the regulation and order of public ceremonies, theatres, amusements and entertainments, &c.; secondly, the judicial police (la police judiciare), with numerous bureaux also, in constant communication with the courts of judicature; thirdly, the administrative police (la police administrative) including bureaux, which superintend navigation, public carriages, animals, public health, &c. Concurrently with these divisions there is the municipal police, which comprises all the agents in enforcing police regulations in the streets or public thoroughfares, acting under the orders of a chief (chef de la police municipale) with a central bureau. The municipal police is divided into two principal branches—the service in uniform of the agents de police and the service out of uniform of inspecteurs de police. In Paris the municipal police are divided among the twenty arrondissements, which the uniform police patrol (see further Paris and Police).
confine was put in operation the following year. There were, however, but few prisons in France adapted for the cellular system and the one at Arles is the exception. In 1850 and 1898 the old Paris prisons of Grande-Roquette, Saint-Pélagis, and Mazas were demolished, and to replace them a large prison with 1500 cells was erected at Fresnes-lès-Rungis. There are (1) the maison d'arrêt, temporary places of durance in every arrondissement for persons charged with offenses, and those sentenced to more than a year's imprisonment who are awaiting transfer to a maison centrale; (2) the maison de justice, often part and parcel of the former, but only existing in the assize court towns for the safe custody of those tried or condemned at the assizes; (3) departmental prisons, or maisons de correction, for summary convictions, or those sentenced to less than a year, or, if provided with sufficient cells, those amenable to separate confinement; (4) maisons centrales and pénitenciers agricoles, for all sentenced to imprisonment for more than a year, or to hard labour, or to those condemned to travaux forcés for offenses committed in prison. There are eleven maisons centrales, nine for men (Loos, Clairvaux, Beaulieu, Poissy, Melun, Fontevrault, Thouars, Riom and Nimes); two for women (Rennes and Montpellier). The pénitenciers agricoles only differ from the maisons centrales in the matter of régime; there are two—at Casseneuil and Fruchy—in the former, and three, for farm labor, for juvenile offenders and départs de sûreté for prisoners who are travelling, at places where there are no other prisons. For the penal settlements at a distance from France see Deportation.

Finance.

At the head of the financial organization of France, and exercising a general jurisdiction, is the minister of finance, who co-ordinates in one general budget the separate budgets prepared by his colleagues and assigns to each ministerial department the sums necessary for its expenses.

The financial year in France begins on the 1st of January, and the budget of each financial year must be laid on the table of the Chamber of Deputies in the course of the ordinary session of the preceding year in time for the discussion upon it to begin in October and be concluded before the 31st of December. It is then submitted to a special commission of the Chamber of Deputies, elected for one year, who appoint a general reporter and one or more special reporters for each of the ministries. When the Chamber of Deputies has voted the budget it is submitted to a similar course of procedure in the Senate. When the budget has passed both chambers it is promulgated by the president under the title of Loi des finances. In the event of its not being voted before the 31st of December, recourse is had to the system of “provisional twelfths” (douzièmes provisionnelles), whereby the tax assessment is authorized by parliament to be expenses for the two or three months on the scale of the previous year. The expenditure of the government has several times been regulated for as long as six months upon this system.

In each department an official collector (Trésorier payeur général) receives the taxes and public revenue collected therein and accounts to the government treasurer in Paris. In view of his responsibilities he has, before appointment, to pay a large deposit to the treasury. Besides receiving taxes, they pay the creditors of the state in their departments, collect all operations affecting departmental loans, buy and sell government stock (rentes) on behalf of individuals, and conduct certain banking operations. The trésorier nearly always lives at the chief town of the department, and is assisted by a receveur particulier des finances in each arrondissement (except that in which the trésorier himself resides). From the general register of the department the trésorier obtains the names and addresses of the collectors of the tax. The direct taxes are actually collected by perceleurs. In the commune an official known as the receveur municipal receives all moneys due to it, and, subject to the authorization of the mayor, makes disbursements out of it. In communes with a revenue of less than 3,200 the perceuteur fulfills the functions of receveur municipal, but a special official may be appointed in communes with large incomes.

The direct tax fall into two classes, (1) Impôts de répartition (apportionment), the amount to be raised being fixed in advance annually and then apportioned among the departments. They include the land tax, the personal and habitation tax (contribution personnelle-mobilière), and door and window tax. (2) Impôts de qualité, which are levied directly on the individual, who pays his quota according to a fixed tariff. These comprise the tax on buildings1 and the trade-licence tax (impôt des palatines). Besides these, miscellaneous taxes—levied for a security equal to live directes—are included under the heading of direct taxation, e.g. the tax on property in mortmain, dues for the verification of weights and measures, the tax on royalties from mines, on horses, mules and carriages, on meals, etc.

The land tax falls upon land not built upon in proportion to its net yearly revenue. It is collected in accordance with a register of property (cadastre) drawn up for the most part in the first half of the 18th century, dealing with every piece of property in France, and giving details as to area, cost, town, townships, etc. The responsibility of keeping this register accurate and up to date is divided between the state, the departments and the communes, and involves a special service and staff of experts. The building tax consists of a certain percentage of the rental value of the property, and is charged upon the owner.

The personal and habitation tax consists in fact of two different taxes, one imposing a fixed capitation charge on all citizens alike in each department, the charge, however, varying according to the department from 1 fr. 50 c. (18. 3d.) to 4 frs. 50 c. (3s. 9d.), the other levied on every occupant of a furnished house or of apartments in proportion to its rental value.

The tax on doors and windows is levied in each case according to the number of windows and is fixed with reference to population, the inhabitants of the more populous paying more than those of the less populous communes.

The trade-licence tax (impôt des palatines) is imposed on every person carrying on a business and is collected according to the value of their trade. Merchants, retailers, bankers and manufacturers, as well as wholesale and retail traders, and consists of (1) a fixed duty levied not on actual profits but with reference to the extent of a business or calling as indicated by number of employees, population of the locality and other considerations.

(2) An assessment on the letting value of the premises in which a business or profession is carried on.

The administrative staff includes, for the purpose of computing the individual quotas of the direct taxes, a director assisted by contrôleurs in each department to whom, and to whom alone in Paris, the direction générale des contributions directes.

The indirect taxes comprise the charges on registration; stamps; customs; and a group of taxes specially described as "indirect duties on consumption".

Registration (enregistrement) duties are charged on the transfer of property in the way of business (à titre onéreux); on changes in ownership effected in the way of donation or succession (à titre gratuit), and on a variety of other transactions which must be registered according to law. The revenue from stamps includes as its chief items the returns from stamped paper, stamps on good traffic, securities and share certificates and receipts and cheques.

The Direction générale de l'enregistrement, des domaines et du timbre, comprising a central department and a director and staff of agents in each department, combines the administration of state property (not including forests) with the exaction of registration and stamp duties.

The Customs (douane), at one time only a branch of the administration of the contributions indirectes, were organized in 1869 as a special service. The central office at Paris consists of a directeur général and administrative, nominated by the president of the republic. These officials form a council of administration presided over by the minister of finance. The service in the departments comprises brigades, which are actually engaged in guarding the frontiers, and a central staff (service des douanes) entrusted with the direction of the duties. There are twenty-four districts, each under the control of a directeur, assisted by inspectors, sub-inspectors and other officials. The chief towns of these districts are Algiers, Bayonne, Besançon, Bordeaux, Boulogne, Brest, Chambery, Cluny, Epinal, Grenoble, Laon, Laval, Marseilles, Montpellier, Nancy, Nantes, Nice, Paris, Perpignan, Rouen, St-Malo, Valenciennes. There is also an official performing the functions of a directeur at Bastia, in Corsica.

The group generally described as indirect taxes includes those on alcohol, wine, beer, cider and other alcoholic drinks, on passenger and goods traffic by railway, on licences to distillers, spirit-sellers, &c., on salt and on sugar of home manufacture. The collection of these excise duties (impôts indirects) is entrusted to inspectors of commerce and to retailers, is assigned to a special service in each department subordinated to a central administration. To the above taxes must be added the tax on Stock Exchange transactions and the tax of 4% on dividends from stocks and shares (other than state loans).

Other main sources of revenue are: the domains and forests managed by the state; government monopolies, comprising tobacco, matches, gunpowder; post offices, telegraphs, telephones; and state

1 The tax on land (propriétés non bâties) and that on buildings (propriétés bâties) are included under the head of contribution foncière.

The French debt as constituted in 1905 was made up of funded debt and floating debt as follows:

- **Funded Debt.**
  - Perpetual 3% rentes: £887,870,400
  - Terminus 3% rentes: £149,500,000

- **Floating Debt.**
  - Exchequer bills: £9,923,480
  - Liabilities on behalf of communes and public establishments, including departmental services: 17,366,500
  - Deposit and current accounts of Caisse des dépôts, etc., including savings banks: 15,328,840
  - Caution money of Trésoriers payeurs-généraux: 1,431,680
  - Other liabilities: 4,450,200

- Total of floating debt: £50,506,720

**Departmental Finances.**—Every department has a budget of its own, which is prepared and presented by the prefect, voted by the departmental council and approved by decree of the president of the republic. The ordinary revenues include the revenues from the property of the department, the produce of additional rentes, which are levied in conjunction with the direct taxes for the maintenance of both departmental and communal finances, state subventions and contributions of the communes towards certain branches of poor relief and to maintenance of roads. The chief expenses of the departments are the care of pauper children and lunatics, the maintenance of high-roads and the service of the departmental debt.

**Communal Finances.**—The budget of the commune is prepared by the mayor, voted by the municipal council and approved by the prefect. But in communes the revenues of which exceed £20,000, the budget is always submitted to the president of the republic. The ordinary revenues include the produce of additional rentes, allocated to communal purposes, the rents and profits of communal property, sums produced by municipal taxes and dues, concessions to gas, water and other companies, and by the octrois (q.v.) or duty on a variety of articles imported into the commune for local consumption. The repairing of highways, the upkeep of public buildings, the support of public education, the remuneration of numerous officials connected with the collection of state taxes, the keeping of the cadastre, etc., constitute the principal objects of communal expenditure.

The departments and the communes have considerable public debts. The departmental debt in 1904 stood at £24 million, and the communal debt at £153 million pounds. (R. T.)

**Army.**

Recruiting and Strength.—Universal compulsory service was adopted after the disasters of 1870-1871, though in principle it had been established by Marshal Ney’s reforms a few years before that date. The most important of the recruiting laws passed since 1870 are those of 1872, 1889 and 1905, the last the “loi de deux ans” which embodies the last efforts of the French war department to keep pace with the ever-growing numbers of the German empire. Compulsory service with the colours is in Germany no longer universal, as there are twice as many able-bodied men presented by the recruiting commissions as the active army can absorb. France, with a greatly inferior population, has every man who is physically capable. This law naturally made a deep impression on military Europe, not merely because the period of colour service was reduced—Germany had taken this step years before—but because of the almost entire absence of the usual exemptions.

1 With revenues of over £1200.
2 For a history of the French debt, see C. F. Bastable, Public Finance (1903).
3 In 1894 the rentes then standing at 4% were reduced to 3% and in 1902 to 3%.

railways. An administrative tribunal called the cour des comptes subjects the accounts of the state’s financial agents (trésoriers-payeurs, receveurs of registration fees, customs, of indirect taxes, &c.) and of the communes to a close investigation, and a vote of definite assessment is finally passed by parliament. The Cour des Comptes, an ancient tribunal, was abolished in 1791, and reorganized by Napoleon I. in 1807. It consists of a president and 110 other officials, assisted by 25 auditors. All these are nominated for life by the president of the republic. Besides the accounts of the state and of the various institutions, the state of its institutions and training colleges and a general variety of other public establishments are scrutinized by the Cour des Comptes.

The chief item of expenditure, which was 148,800 pounds sterling, was the sum assigned to the ministry of finance (591 millions in all) of 8% of the tax established in the expense of the state. The outgoings were the ministry of war (the expenditure of which rose from 254 millions in 1805 to over 30 millions in 1895), the ministry of marine (103 millions in 1805, over 121 millions in 1805), the ministry of public works (with an expenditure in 1905 of over 20 millions, 10 millions of which was assigned to posts, telegraphs and telephones) and the ministry of public instruction, fine arts and public worship, the expenditure on education having risen from 8½ millions in 1805 to 93 millions in 1895.

**Public Debt.**—The national debt of France is the heaviest of any country in the world. Its foundation was laid early in the 17th century, and the continuous wars of succeeding centuries, combined with the extravagance of the monarchs, as well as deliberate disregard of financial and economic conditions, increased it at an alarming rate. The duke of Sully carried out a revision in 1604, and other attempts were made by Mazarin and Colbert, but the extravagances of Louis XV. swelled it again heavily. In 1763 the national debt amounted to £60,000,000 livres, and its annual charge to £3,000,000 livres. A consolidation was effected in 1793, but the lavish issue of assignats (q.v.) destroyed whatever advantage might have accrued, and the debt was again dealt with by a law of the 9th of Vendémiaire year IX. (November 1799) by an annual interest paid yearly to creditors then amounting to 40,216,000 francs (£1,600,000). During the Directory a sum of £260,000 was added to the interest charge, and by 1814 this annual charge had risen to £2,530,000. This large increase is to be explained by the fact that during the Napoleonic régime the government steadily refused to return convertible paper currency or to meet war expenditure by borrowing. The following table shows the increase of the funded debt since 1814.
ARMY]

FRANCE

795

Even broad-winners are required to serve, the state pensioning their dependants (75 centimes per diem, up to 10% of the strength) during their period of service. Dispetcations, and also the one-year volun'atiant, which had become a short cut for the so-called "intellectual class" to employment in the civil service rather than a means of training reserve officers, were abolished. Every Frenchman therefore is a member of the army practically or potentially from the age of twenty to the age of forty-five. Each year there is drawn up in every commune a list of the young men who attained the age of twenty during the previous year. These young men are then examined by a revising body (Conseil de révision cantonal) composed of civil and military officials. Men physically unfit are wholly exempted, and men who have not, at the time of the examination, attained the required physical standard are put back for re-examination after an interval. Men who, otherwise suitable, have some slight infirmity are drafted into the non-combatant branches. The minimum height for the infantry soldier is 1.54 m., or 5 ft. 1 in., but men of special physique are taken below this height. In 1904, under the old system of three-years' service with a one-year voluntary, 32,473 men became liable to incorporation, of whom 25,432 were rejected as unfit, 55,265 were admitted as one-year volunteers, 62,160 were put back, 27,825 had already enlisted with a view to making the army a career, 5,257 were taken for the navy, and thus, with a few extra details and casualties, the contingent for full service dwindled to 147,549 recruits. In 1906, 326,793 men had to present themselves, 25,348 had already enlisted, 40,032 men were put back, 33,777 found unfit, which, deducting 3,128 details, gives an actual incorporated contingent of 191,901 young men of twenty-one to serve for two full years (in each case, for the sake of comparison, men put back from former years who were enrolled are omitted). In theory a two-years' contingent of course should be half as large again as a three-years' one, but in practice, France has not men enough for so great an increase. Still the law of 1905 provides a system whereby there is room with the colours for every available man, and moreover ensures his services. The net gain in the 1906 class is of the order of 50,000, and the proportion of the new contingent to the old is practically 2:1. The loi des cadres of 1907 introduced many important changes of detail supplementary to the loi de deux ans. Important changes were also made in the provisions and administration of military law. The active army, then, at a given moment, say November 1, 1908, is composed of all the young men, not legally exempted, who have reached the age of twenty in the years 1906 and 1907. It is at the disposal of the minister of war, who can decree the recall of all men discharged to the reserve the previous year and all those whose time of service has for any reason been shortened. The reserve of the active army are composed of those who have served the legal period in the active army. These are recalled twice, in the eleven years during which they are members of the reserve, for refresher courses. The active army and its reserve are not localized, but drawn from and distributed over the whole of France. The advantages of a purely territorial system have tempted various War Ministers to apply it, but the results were not good, owing to the want of uniformity in the military quarters and the political subdivision of the different districts. One result of this is that mobilization and concentration are much slower processes than they are in Germany.

The Territorial Army and its reserve (members of which undergo two short periods of training) are, however, allocated to local service. The soldier spends six years in the Territorial Army, and six in the reserve of the Territorial Army. The reserves of the active army and the Territorial Army and its reserve can only be recalled to active service in case of emergency and by decree of the head of the state.

The total service rendered by the individual soldier is thus twenty-five years. He is registered at the age of twenty, is called to the colours on the 1st of October of the next year, discharged to the active army reserve on the 30th of September of the second year thereafter, to the Territorial Army at the same date thirteen complete years after his incorporation, and finally discharged from the reserve of the Territorial Army on the twenty-fifth anniversary of his entry into the active army. On November 1, 1908, then the active army was composed of the classes registered 1906 and 1907, the reserve of the classes 1895-1905, the Territorial Army of those of 1890-1894 and the Territorial Army reserve of those of 1883-1888.

In 1906 the peace strength of the army in France was estimated at 532,593 officers and men; in Algeria 54,580; in Tunis 20,320; total 607,493. Deducting vacancies, sick and absent, the effective strength of the active army in 1906 was 540,562; of the gendarmerie and Garde Républicaine 24,512; of colonial troops in the colonies 38,568. The full number of persons liable to be called upon for military service and engaged in such service is calculated (1908) as 4,800,000, of whom 1,350,000 of the active army and the younger classes of army reserve would constitute the field armies set on foot at the outbreak of war. 150,000 horses and mules are maintained on a peace footing and 600,000 on a war footing.

Organization.—The general organization of the French army is in many respects based on the best of the permanent army corps, the headquarters of which are as follows: I. Amiens; III. Rouen; IV. Le Mans; V. Orléans; VI. Châlons-sur-Marne, VII. Besançon; VIII. Bourges; IX. Tours; X. Rennes; XI. Nantes; XII. Limoges; XIII. Clermont-Ferrand; XIV. Lyons; XV. Marseilles; XVI. Montpellier; XVII. Toulouse; XVIII. Bordeaux; XIX. Algiers and XX. Nancy. Each army corps consists in principle of two infantry divisions, one cavalry brigade, one brigade of horse and field artillery, one engineer battalion and one squadron of train. But certain army corps have a special organization. The VI. corps (Châlons) and the VII. (Besançon) consist of three divisions each, and the XIX. (Algiers) three divisions of its own as well as the division occupying Tunis. There is in addition to these corps there are eight permanent cavalry divisions with headquarters at Paris, Luneville, Meaux, Sedan, Reims, Lyons, Melun and Dôle. The military government of Paris is independent of the army corps system and comprises, besides a division of the colonial army corps (see below), 34 others detached from the I., III., IV. and V. corps, as well as the 1st and 3rd cavalry divisions and many smaller bodies of troops. The military government of Lyons is another independent and special command; it comprises practically the XIV. army corps and the 6th cavalry division. The infantry division consists of 2 brigades, each of 2 regiments of 3 or 4 battalions (the 4 battalion regiments have recently been reduced for the most part to 3), with 1 squadron cavalry and 12 batteries, attached from the corps troops, in war a proportion of the artillery would, however, be taken back to form the corps artillery (see ARTILLERY and TACTICS). The cavalry division consists of 2 or 3 brigades, each of 2 regiments or 8 squadrions, with 2 horse artillery batteries attached. The army corps consists of headquarters, 2 (or 3) infantry divisions, 1 cavalry brigade, 1 artillery brigade (2 regiments, comprising 21 field and 2 horse batteries), 1 engineer battalion, &c. In war a group of "Rimailli" heavy howitzers (see ORDNANCE: Heavy Field and Light Siege Units) would be attached. It is proposed, and accepted in principle, to increase the number of guns in the army corps by converting the horse batteries in 18 regiments to field batteries, which, with other measures, enables the number of the latter to be increased to 36,144 guns.

1 Algerian native troops are recruited by voluntary enlistment. But in 1908, owing to the prevailing want of trained soldiers in France, it was proposed to set free the white troops in Algeria by applying the principles of universal service to the natives, as in Tunis.
regiments of cuirassiers, 32 of dragoons, 21 of chasseurs à cheval, 14 of hussars, 6 of chasseurs d'Afrique and 4 of Spahis (Algerian natives); (c) 40 regiments of artillery, comprising 445 field batteries, 14 mountain batteries and 52 horse batteries (see, however, above), 18 battalions of garrison artillery, with in addition 13 companies of artificers, &c.; (d) 6 regiments of engineers forming 22 battalions, and 1 railway regiment; (e) 20 squadrons of trains, 27 legions of gendarmerie and the Paris Garde Républicaine, administrative and medical units.

Colonial Troops.—These form an expeditionary army corps in France to which are attached the actual corps of occupation to the various colonies, part white, part natives. The colonial army corps, headquarters at Paris, has three divisions, at Paris, Toulon and Brest.

The French colonial (formerly marine) infantry, recruited by voluntary enlistment, comprises 18 regiments and 5 independent battalions (of which 12 regiments are at home), 74 batteries of field, fortress and mountain artillery (of which 32 are at home), with a few cavalry and engineers, &c., and other services in proportion. The native troops include 13 regiments and 8 independent battalions. The strength of this army corps is 28,700 in France and 61,300 in the colonies.

Command.—The commander-in-chief of all the armed forces is the president of the Republic, but the practical direction of affairs devolves on the Minister of the Interior in war, who is assisted by the Conseil supérieur de la guerre, a body of senior generals who have been selected to be appointed to the higher commands in war. The vice-president is the destined commander-in-chief of the field armies and is styled the generalissimo. The chief of staff of the army is also a member of the council. In war the latter would probably remain at the ministry of war in Paris, and the generalissimo would have his own chief of staff. The ministry of war is divided into branches for infantry, cavalry, &c.—and services for special subjects such as military law, explosives, health, &c. The general staff (État major de l'armée) has its functions classified as follows: personnel, material and finance; 1st bureau (organization and mobilization), 2nd (intelligence), 3rd (military operations and training) and 4th (communications and transport); and the famous historical section. The president of the Republic has a military household, and the minister a cabinet, both of which are occupied chiefly with questions of promotion, patronage and decorations.

The general staff and also the staff of the corps and divisions are composed of certificated (brevétés) officers who have passed all through the École de Guerre. In time of peace an officer is assigned to the staff for no more than five years; he must then return to regimental duty for at least two years.

The officers of the army are obtained partly from the old-established military schools, partly from the ranks of the non-commissioned officers, the proportion of the latter being about one-third of the total number of officers. Artillery and engineer officers come from the École Polytechnique, infantry and cavalry from the École spéciale militaire de St-Cyr. Other important training institutions are the staff college (École supérieure de Guerre) which trains annually 70 to 90 selected captains and lieutenants; the musketry school of Châlons, the gymnastic school at Joinville-le-Pont and the schools of St Maixent, Saumur and Versailles for the preparation of non-commissioned officers for commissions in the infantry, cavalry, artillery and engineers respectively. The non-commissioned officers are, as usual in universal service armies, drawn partly from men who voluntarily enlist at a relatively early age, and partly from men who at the end of their compulsory period of service are re-engaged. Voluntary enlistments in the French army are permissible, within certain limits, at the age of eighteen, and the engagés serve for at least three years. The law further provides for the re-engagement of men of all ranks, under conditions varying according to their rank. Such re-engagements are for one to three years' effective service but may be extended to fifteen. They date from the time of the legal expiry of each man's compulsory active service. Rengagés receive a bounty, a higher rate of pay and a pension at the conclusion of their service.

The total number of men who had re-enlisted stood in 1893 at 8,994.

Armament.—The field artillery is armed with the 75 mm. gun, a shielded quick-firer (see ORDNANCE: Field Equipments, for illustration and details); this weapon was the forerunner of all modern models of field gun, and is handled on tactical principles specially adapted for it, which gives the French field artillery a unique position amongst the military nations. The infantry, which was the first in Europe to be armed with the magazine rifle, still carries this, the Lebel, rifle which dates from 1886. It is believed, however, that a satisfactory type of automatic rifle (see RIFLE) has been evolved and is now (1908) in process of manufacture. Details are kept strictly secret. The cavalry weapons are a straight sword (that of the heavy cavalry is illustrated in the article SWORD), a bamboo lance and the Lebel carbine.

It is convenient to mention in this place certain institutions attached to the war department and completing the French military organization. The Hôtel des Invalides founded by Louis XIV. and Louvois is a house of refuge for old and infirm soldiers of all grades. The number of the inmates is decreasing; but the institution is an expensive one. In 1875 the "Invalides" numbered 642, and the hotel cost the state 1,125,053 francs. The order of the Legion of Honour is treated under KNIGHTHOOD.

The Médaille militaire is awarded to private soldiers and non-commissioned officers who have distinguished themselves or rendered long and meritorious services. This was introduced in 1852, carries a yearly pension of 100 frs. and has been granted occasionally to officers.

Fortifications.—After 1870 France embarked upon a policy of elaborate frontier and inner defences, with the object of ensuring, as against an unexpected German invasion, the time necessary for the effective development of her military forces, which were then in process of reorganization. Some information as to the types of fortification adopted in 1870-1875 will be found in FORTIFICATION and SIEGECRAFT. The general lines of the scheme adopted were as follows: On the Meuse, which forms the principal natural barrier on the side of Lorraine. Verdun (q.v.) was fortified as a large entrenched camp, and along the river above this were constructed a series of forts d'arrêt (see MEUSE LINE) ending in another entrenched camp at Toul (q.v.). From this point a gap (la trouée d'Épinal) was left, so as in some sort to canalize the flow of invasion (General Bonnal), until the upper Moselle was reached at Épinal (q.v.). Here another entrenched camp was made and from it the Moselle line of forts d'arrêt continues the barrier to Belfort (q.v.), another large entrenched camp, beyond which no further fortifications at Montbéliard and the Lomont range carries the line of defence to the Swiss border, which in turn is protected by works at Pontarlier and elsewhere. In rear of these lines Verdun-Toul and Épinal-Belfort, respectively, lie two large defended areas in which under certain circumstances the main armies would assemble preparatory to offensive movements. One of these areas is defined by the three fortresses, La Fère, Laon and Reims, the other by the triangle, Langres—Dijon—Besançon. On the side of Belgium the danger of irruption through neutral territory, which has for many years been foreseen, is provided against by the fortresses of Lille, Valenciennes and Maubeuge, but (with a view to tempting the Germans to attack through Luxembourg, as is stated by German authorities) the frontier between Maubeuge and Verdun is left practically undefended. The real defence of this region lies in the field army which would, if the case arose, assemble in the area La Fère-Reims-Laon.

On the Italian frontier the numerous forts d'arrêt in the mountains are strongly supported by the entrenched camps of Besançon, Grenoble and Nice. Behind all this huge development of fixed defences lie the central fortresses of Paris and Lyons. The defences of the Spanish frontier consist of the entrenched camps of Bayonne and Perpignan and the various small forts d'arrêt of the Pyrenees. Of the coast defences the principal are Toulon, Antibes, Rochefort, Lorient, Brest, Oléron, La Rochelle, Belle-Isle, Cherbourg, St-Malo, Havre, Calais, Gravelines and Dunkirk.
A number of the older fortresses, dating for the most part from Louis XIV.'s time, are still in existence, but are no longer of military importance. Such are Arras, Longwy, Mézières and Montmédy.

**Naval Administration.**—The head of the French navy is the Minister of War, who like the other ministers is appointed by decree of the head of the state, and is usually a civilian. He selects for himself a staff of civilians (the cabinet du ministre), which is divided into bureaux for the despatch of business. The head of the cabinet prepares for the consideration of the minister all the business of the navy, especially questions of general importance. His chief professional assistant is the chef d'état-major général (chief of the general staff), a vice-admiral, who is responsible for the organization of the naval forces, the mobilization and movements of the fleet, &c.

The central organization also comprises a number of departments (services) entrusted with the various branches of naval administration, such as administration of the active fleet, construction of ships, arsenals, recruiting, finance, &c. The minister has at his disposal the Conseil supérieur de la Marine, over which he presides, consisting of three vice-admirals, the chief of staff and some other members. The Conseil supérieur devotes its attention to all questions touching the fighting efficiency of the fleet, naval bases and arsenals and coast defence. Besides the Conseil supérieur the minister is advised on a very wide range of naval topics (including pay, quarters and recruiting) by the Comité consultatif de la Marine. Advisory committees are also appointed to deal with special subjects, e.g. the commissions de classement which attend to questions of promotion in the various branches of the navy, the naval works council and others.

The French coast is divided into five naval arrondissements, which have their headquarters at the five naval ports, of which Cherbourg, Brest, and Toulon are the most important, Lorient and Rochefort being of lesser degree. All are building and fitting-out yards. Each arrondissement is divided into sous-arrondissements, having their centres in the great commercial ports, but this arrangement is purely for the embodiment of the men of the Inscription Maritime, and has nothing to do with the dockyards as naval arsenals. In each arrondissement the vice-admiral, who is naval prefect, is the immediate representative of the minister of marine, and has full direction and command of the arsenal, which is his headquarters. He is thus commander-in-chief, as also governor-designate for time of war, but his authority does not extend to ships belonging to organized squadrons or divisions. The naval prefect is assisted by a rear-admiral as chief of the staff (except at Lorient and Rochefort, where the office is filled by a captain), and a certain number of other officers, the special functions of the chief of the staff having relation principally to the efficiency and personnel of the fleet, while the "major-general," who is usually a rear-admiral, is concerned chiefly with the matériel. There are also directors of stores, of naval construction, of the medical service, and of the submarine defences (which are concerned with torpedoes, mines and torpedo-boats), as well as of naval ordnance and works. The prefect directs the operations of the arsenal, and is responsible for its efficiency and for that of the ships which are there in reserve. In regard to the constitution and maintenance of the naval forces, the administration of the arsenals is divided into three principal departments, the first concerned with naval construction, the second with ordnance, including gun-mountings and small-arms, and the third with the so-called submarine defences, dealing with all torpedo matériel.

The French navy is manned partly by voluntary enlistment, partly by the transference to the navy of a certain proportion of each year's recruits for the army, but mainly by a system known as inscription maritime. This system, devised and introduced by Colbert in 1661, has continued, with various modifications, ever since. All French sailors between the ages of eighteen and fifty must be enrolled as members of the armée de mer. The term sailor is used in a very wide sense and includes all persons earning their living by navigation on the sea, or in the harbours or roadsteads, or on salt lakes or canals within the maritime domain of the state, or on rivers and canals as far as the tide goes up or sea-going ships can pass. The inscription usually begins his service at the age of twenty and passes through a period of obligatory service lasting seven years, and generally comprising five years of active service and two years furlough.

Besides the important harbours already referred to, the French fleet has naval bases at Oran in Algeria, Bizerta in Tunisia, Saigon in Cochin China and Hong-kong in Tongking, Diego-Suarez in Madagascar, Dakar in Senegal, Fort de France in Martinique, Nouméa in New Caledonia.

The ordnance department of the navy is carried on by a large detachment of artillery officers and artificers provided by the war office for this special duty.

The fleet is divided into the Mediterranean squadron, the Northern squadron, the Atlantic division, the Far Eastern division, the Pacific division, the Indian Ocean division, the Cochin China division.

The chief naval school is the École navale at Brest, which is devoted to the training of officers; the age of admission is from fifteen to eighteen years, and pupils after completing their course pass a year on a frigate school. At Paris there is a more advanced school (École supérieure de la Marine) for the supplementary training of officers. Other schools are the school of naval medicine at Bordeaux with annexes at Toulon, Brest and Rochefort; schools of torpedoes and mines and of gunnery at Toulon, &c., &c. The écoles d'hydrographie established at various ports are for theoretical training for the higher grades of the merchant service. (See also Navy.)

The total personnel of the armée de mer in 1909 is given as 56,800 officers and men. As to the number of vessels, which fluctuates from month to month, little can be said that is wholly accurate at any given moment, but, very roughly, the French navy in 1909 included 25 battleships, 7 coast defence ironclads, 19 armoured cruisers, 36 protected cruisers, 22 Sloops, gunboats, &c., 45 destroyers, 319 torpedo boats, 71 submarines and 8 auxiliary cruisers. It was stated that, according to proposed arrangements, the principal fighting elements of the fleet would be, in 1919, 34 battleships, 36 armoured cruisers, 6 smaller cruisers of modern type, 109 destroyers, 170 torpedo boats and 171 submarines and submarines. The budgetary cost of the navy in 1908 was stated as 312,000,000 francs ($12,480,000).

(C. F. A.)

**Education.**

The burden of public instruction in France is shared by the communes, departments and state, while side by side with the public schools of all grades are private schools subjected to a state supervision and certain restrictions. At the head of the whole organization is the minister of public instruction. He is assisted and advised by the superior council of public instruction, over which he presides.

France is divided into sixteen académies or educational districts, having their centres at the seats of the universities. The capitals of these académies, together with the departments included in them, are tabulated below:

For the administrative organization of education in France see Education.

Any person fulfilling certain legal requirements with regard to capacity, age and character may set up privately an educational establishment of any grade, but by the law of 1904, all religious congregations are prohibited from keeping schools of any kind whatever.

Primary Instruction.—All primary public instruction is free and compulsory for children of both sexes between the ages of six and thirteen. A child may gain a certificate of primary studies if it has passed through an establishment of the commune of their intention and the school chosen. If educated at home, the child (after two years of the compulsory period has expired) must undergo a yearly examination, and if it is unsatisfactory the parents will be compelled to send him to a public or private school.

Each commune is in theory obliged to maintain at least one primary public school, but with the approval of the minister, the departmental council may authorize a commune to combine with other communes in the upkeep of a school. If the number of inhabitants exceeds 500, the commune must also provide a special school for girls, unless the Departmental Council authorizes it to substitute a mixed school. Each department is bound to maintain two primary schools, one and two preparatory schools—of primary schools. There are two higher training colleges of primary instruction at Fontenay-aux-Roses and St Cloud for the training of mistresses and masters of training colleges and higher primary schools.

The Laws of 1882 and 1886 "laicized" the schools of this class, the former suppressing religious instruction, the latter providing that only laymen should be eligible for masterships. There were also two other grades, 6 to 13; the commune is in theory bound to maintain one primary schools—of primary schools; these are the ordinary schools for children from six to thirteen; (3) higher primary schools (écoles primaires supérieures) and "supplementary courses"; these admit pupils who have gained the primary (l'écrit de première supérieure), an official nominated by the minister, and assisted by a teaching staff of professors and chargés de cours or teachers of somewhat lower standing. To become professor in a lycée it is necessary to pass an examination known as the "agrégation" candidates for which must be licentiates of a faculty (or have passed through the Ecole normale supérieure).

The system of studies—reorganized in 1902—embraces a full curriculum of seven years, which is divided into two periods. The first lasts four years, and at the end of this the pupil may obtain (after examination) the "certificate of secondary studies." During the second period the pupil has a choice of four courses: (1) Latin and Classical; (2) Latin and Modern Languages; (3) Arts and modern Languages. At the end of this period he presents himself for a degree called the Baccalauréat de l'enseignement secondaire. This is granted (after two examinations) by the faculties of letters and sciences (below), and in many cases it is necessary for a student to hold this general degree before he may be enrolled in a particular faculty of a university and proceed to a Baccalauréat in a particular subject, such as law, theology or medicine.

The colleges, though of a lower grade, are in most respects similar to the lycées, but they are financed by the communes: the professors may have certain less important qualifications in lieu of the "agrégation." Private secondary schools are subject to state inspection. The inspectors must not belong to any congregation and must have a diploma of aptitude for teaching and the degree of "licenciat." The establishment of lycées for girls was first attempted in 1880. They give an education similar to that offered in the lycées for boys—except that the "agrégation" is taken in a mixed lycée.

Higher education is given by the state in the universities, and in special faculties, schools and colleges. The freedom of higher education, by private individuals and bodies in private schools and "faculties" (facultés libres). The law of 1880 reserved the state's "faculties" the right to confer degrees, and the government has the power to annul the degrees of private schools or faculties. There are five kinds of faculties: medicine, letters, science, law and Protestant theology. The faculties of letters and sciences, besides granting the Baccalauréat de l'enseignement secondaire, confer the degree of licenciat (Licence, the Doctorat). The faculties of medicine confer the degree of doctor of medicine. The faculties of theology confer the degrees of bachelor, licentiate and doctor of theology. The faculties of law confer the degree of doctor of laws and also grant certificates of "licenciat" which enable the holder to practise as an avocat. "Licence" is necessary for the profession of barrister. Students of the private faculties have to be examined by and take their degrees from the state faculties. There are 2 faculties of Protestant theology (Paris and Montpellier), and 1 in Catholic theology (Paris), and 4 joint faculties of medicine and pharmacy (Bordeaux, Lille, Lyons, Montpellier). In addition, there are (1) 3 faculties of law (Caen, Grenoble, Lille, Lyons, Montpellier, Nancy, Poitiers, Rennes, Toulouse); 3 faculties of medicine (Paris, Montpellier and Nancy), and 4 joint faculties of medicine and pharmacy (Bordeaux, Lille, Lyons, Montpellier, Toulouse); 13 faculties of letters (at the same towns, substituting Aix for Marseilles). The principal faculties have a similar number of institutions, both state-supported and private, giving higher instruction of various special kinds. In the first class must be mentioned the Collège de France, founded 1530, giving courses of highest study of all sorts, the Museum of National History, the Collège des Chartes (palaeography and numismatics), the School of Modern Oriental Languages, the School of the History of Art, the Laboratoire de Pratique des Hautes Études (scientific research), etc. All these institutions are in Paris. The most important free institution in this class is the Ecole des Sciences Politiques, which prepares pupils for the highest offices in the State and Public Administration, and which has numerous relations with foreign countries, not included in the state programmes.

Commercial and technical instruction is given in various institutions and in the public and private establishments, such as Écoles nationales professionnelles of Armentières, Vierzon, Vouzon and Nantes for the education of working men; the more advanced Écoles d'arts et métiers of Châlons, Angers, Aix, Lille and Cluny; and the Centre d'études de Commerce et d'industrie (b.p.c.i.), which combines the functions of the public universities, the École des Sciences Politiques, the École des Beaux-Arts, and the Conservatoire National de Musique et de Déclamation by the under-secretary for fine arts and other schools.
Colonies.

In the extent and importance of her colonial dominion France is second only to Great Britain. The following table gives the name, area and population of each colony and protectorate as well as the date of acquisition or establishment of a protectorate. It should be noted that the figures for area and population are, as a rule, only estimates, but in most instances they probably approximate closely to accuracy. Detailed notices of the separate countries will be found under their several heads:

| M supporters of the Society for Elementary Instruction, the Polytechnic Association, the Philomathy Association and the French University at Paris; the Philomathy Society of Bordeaux; the Popular Education Society at Havre; the Rhone Society of Professional Instruction at Lyons; the Industrial Society of Amiens and others. The highest institution of learning is the Institut de France, founded and kept up by the French government on behalf of science and literature, and composed of five academies: the Académie française, the Académie des Inscriptions et Belles-Lettres, the Académie des Sciences, the Académie des Beaux-Arts and the Académie des Sciences Morales et Politiques (see Academies). The Académie de Médecine is a separate body.

Poor Relief (Assistance publique).—In France the paupers, as such, have no legal claim to help from the community, which however, is bound to provide for destitute children (see Foundling Hospitals) and pauper lunatics (both these being under the care of the department), aged and infirm people without resources and victims of incurable illness, and to furnish medical assistance gratuitously to those without resources who are afflicted with incurable illness. The funds for these purposes are provided by the department, the commune and the central authority.

There are four main types of public benevolent institutions, all of which are communal in character: (1) The hôpitaux, for maternity cases and cases of incurable illness; (2) the hospices, where the aged poor, cases of incurable malady, orphans, foundlings and other children without means of support, and in some cases lunatics, are received; (3) the bureau de bien-faisance, charged with the provision of out-door relief (secours à domicile) in money or in kind, to the aged poor or those who, though capable of working, are prevented from doing so by illness or strikes; (4) the bureau d'assistance, which dispenses free medical treatment to the destitute.

These institutions are under the supervision of a branch of the ministry of the interior. The hospices and hôpitaux and the hospices de bienfaisance, the foundation of which is optional for the commune, are managed by committees consisting of the mayor of the municipality and six members, two elected by the municipal council and four nominated by the prefect. The members of these committees are unpaid, and have no concern with ways and means which are in the hands of a paid treasurer (recruteur). The bureaux de bienfaisance in the larger centres are aided by unpaid workers (commissaires or dames de charité), and in the big towns by paid inspectors (inspecteurs). Bureau d'assistance exists in every commune, and are managed by the combined committees of the hospices and the bureaux de bienfaisance or by one of these in municipalities, where only one of those institutions exists.

Note on French Colonies.—Funds for hôpitaux, hospices and bureaux de bienfaisance comprise:

1. A 10% surtax on the fees of admission to places of public amusement.
2. A proportion of the sums payable in return for concessions of land in municipal cemeteries.
3. Profits of the communal Monts de Pitié (pawn-shops).
4. Donations, bequests and the product of collections in churches.
5. The product of certain fines.
6. Subventions from the departments and communes.
7. Income from endowments.

(R. Tr.)

It will be seen that nearly all the colonies and protectorates lie within the tropics. The only countries in which there is a considerable white population are Algeria, Tunisia and New Caledonia. The "year of acquisition" in the table, when one date only is given, is the date when the country or some part of it first fell under French influence, and does not imply continuous possession since.

Government.—The principle underlying the administration of the French possessions overseas, from the earliest days until the close of the 19th century, was that of "domination" and "assimilation," notwithstanding that after the loss of Canada and the sale of Louisiana France ceased to hold any considerable colony in which Europeans could settle in large numbers. With
FRANCE

[COLONIES]

800

of West Africa and the Congo have been, with certain modifications, placed under the French tariff.) The budget of all colonies not possessing a council general (see below) must also be approved by the minister. Each colony and protectorate, including Algeria, has a separate budget. As provided by the law of 1900 all local charges are borne by the colonies—supplemented at need by grants in aid—but the military expenses are borne by the state. In all the colonies the judicature has been rendered independent of the executive.

The colonies are divisible into two classes, (1) those possessing considerable powers of local self-government, (2) those in which the local government is autocratic. To this second class may be added the protectorates (and some colonies) where the native form of government is maintained under the supervision of French officials.

Class (1) includes the American colonies, Réunion, French India, Senegal, Cochinchina and New Caledonia. In these colonies the system of assimilation was carried to great lengths. The head of the administration is a governor under whom is a secretary-general, who replaces him at need. The governor is aided by a privy council, an advisory body to which the governor nominates a minority of unofficial members, and a council general, to which is confided the control of local affairs, including the voting of the budget. The councils general are elected by universal suffrage of all citizens and those who, though not citizens, have been granted the political franchise. In Cochinchina, in place of a council general, there is a colonial council which fulfils the functions of a council general.

In the second class of colonies the governor, sometimes assisted by a privy council, on which non-official members find seats, sometimes simply by a council of administration, is responsible only to the minister of the colonies. In Indo-China, West Africa, French Congo and Madagascar, the colonies and protectorates are grouped under governors-general, and to these high officials extensive powers have been granted by presidential decree.

The colonies under the governor-general of West Africa are ruled by lieutenant-governors with restricted powers, the budget of each colony being fixed by the governor-general, who is assisted by an advisory government council comprising representatives of all the colonies under his control. In Indo-China the governor-general has under his authority the lieutenant-governor of the colony of Cochinchina, and the residents superior at the courts of the kings of Cambodia and Annam and in Tongking (nominally a viceroyalty of Annam). There is a superior council for the whole of Indo-China on which the natives and the European commercial community are represented, while in Cochinchina a privy council, and in the protectorates a council of the protectorate, assists in the work of administration. In each of the governments general there is a financial controller with extensive powers who corresponds directly with the metropolitan authorities (decree of March 22, 1907). Details and local differences in form of government will be found under the headings of the various colonies and protectorates.

Colonial Finances.—The cost of the extra-European possessions, other than Algeria and Tunisia, to the state is shown in the expenses of the colonial ministry. In the budget of 1883 these expenses were put at £1,380,000; in 1895 they had increased to £3,200,000, but in 1900 to £5,100,000. In 1905 they were placed at £14,431,000. Part of the expenses are incurred in the conduct of the colonial army.

The Colonial army is nevertheless attached (law of 1900) to the ministry of war. The colonial minister is assisted by a number of organizations of which the most important is the superior council of the colonies (created by decree in 1883), an advisory body which includes the senators and deputies elected by the colonies, and delegates elected by the universal suffrage of all citizens in the colonies and protectorates which do not return members to parliament. To the ministry appertains the duty of fixing the duties on foreign produce in those colonies which have not, by law, subjected to the same tariff as in France. (Nearly all the colonies save those

1 In 1906 the number of registered electors in these colonies was 199,065, of whom 106,675 exercised their suffrage.
2 In the case of Madagascar by decree of the 11th of December 1895.
The authorized colonial loans, omitting Algeria and Tunisia, dating the period 1884-1904 amounted to £10,140,000, the sums paid for interest and sinking funds on loans varying from £600,000 to £800,000 a year. The amount of French capital invested in French colonies and protectorates, including Algeria and Tunisia, was estimated in 1905 at £210,000,000, French capital invested in foreign countries at the same date being estimated at ten times that amount (see Quo. Dip. Col. et. Col., February 16, 1905).

Commerce.—The value of the external trade of the French possessions in Africa and the Orient, increased in the ten years 1896-1905 from £18,784,060 to £24,957,479. In the last-named year the commerce of Algeria amounted to £24,506,020, and that of Tunisia to £5,999,246, making a grand total for French colonial trade in 1905 of £56,432,246. The figures were made up as follows:

Over three-fourths of the trade of Algeria and Tunisia is with France and other French possessions. In the other colonies and protectorates more than half the trade is with foreign countries. The foreign countries trading most largely with the French colonies are, in the order named, British colonies and Great Britain, China and Japan, the United States, Germany, and Italy. The trade with British colonies and Great Britain in 1905 was over £7,200,000.

The identity of the earliest inhabitants of Gaul is veiled in obscurity, though philologists, anthropologists, and archaeologists are using the glimmering traditions collected by ancient historians. A fair picture is given of a people of the Bronze Age. The subjugation of those primitive tribes did not mean their annihilation: their blood still flows in the veins of Frenchmen; and they survive also on those megalithic monuments (see Stone Monuments) with which the soil of France is dotted, in the drawings and sculptures of caves hollowed out along the sides of the valleys, and in the arms and ornaments yielded by sepulchral tumuli, while the names of the rivers and mountains of France probably perpetuate the first utterances of those nameless generations.

The first peoples of whom we have actual knowledge are the Iberians and Ligurians. The Basques who now inhabit both sides of the Pyrenean range are probably the last representatives of the Iberians, who came from Spain to settle between the Mediterranean and the Bay of Biscay. The Ligurians, who exhibited the hard cunning characteristic of the Genoese Riviera, must have been descendants of that Indo-European vanguard who occupied all northern Italy and the centre and south-east of France, who in the 7th century B.C. received the Phocaean immigrants at Marseille, and who at a much later period were encountered by Hannibal during his march to Rome, on the banks of the Rhône, the frontier of the Iberian and Ligurian territories. Upon these people it was that the conquering minority of Celts or Gauls imposed themselves, to be succeeded at a later date by the Roman aristocracy.

When Gaul first enters the field of history, Rome has already laid the foundation of her freedom. Athens dazzles the eastern Mediterranean with her literature and her art, while in the west Carthage and Marseilles are lining opposite shores with their great houses of commerce. Coming from the valley of the Danube in the 6th century, the Celts or Gauls had little by little occupied central and southern Europe long before they penetrated into the plains of the Saône, the Seine, and the Loire as far as the Spanish border, driving out the former inhabitants of the country. A century later their political hegemony, extending from the Black Sea to the Strait of Gibraltar, began to disintegrate, and the Gauls then embarked on more distant migrations, from the Columns of Hercules to the plateaux of Asia Minor, taking Rome on their way. Their empire in Gaul, encroached upon in the north by the Belgae, a kindred race, and in the south by the Iberians, gradually contracted in area and eventually crumbled to pieces. This process served the turn of the Romans, who little by little had subdued first the Cisalpine Gauls and afterwards those inhabiting the south-east of France, which was turned into a Roman province in the 2nd century. Up to this time Hellenism and the mercantile spirit of the Jews had almost exclusively dominated the Mediterranean littoral; and at first the Latin spirit only won foothold for itself in various spots on the western coast—as at Aix in Provence (125 B.C.) and at Narbonne (116 B.C.). A refuge of Italian pauperism in the time of the Gracchi, after the triumph of the oligarchy the Narbonnaise became a field for shameless exploitation, besides providing, under the provocation of Caesar, an excellent point of observation whence to watch the intestine quarrels between the different nations of Gaul.

These are divided by Caesar in his Commentaries into three groups: the Aquitanians to the south of the Garonne; the Celts, properly so called, from the Garonne to the Seine and the Marne; and the Belgae, from the Seine to the Rhine. But these ethnological names cover a very great variety of half-savage tribes, differing in speech and in institutions, each surrounded by frontiers of dense forests abounding in game. On the edges of these forests stood isolated dwellings like sentinel outposts; while the inhabitants of the scattered hamlets, caves hollowed in the ground, rude circular huts or lake-dwellings, were less occupied with domestic life than with war and the chase. On the heights, as at Bibracte, or on islands in the rivers, as at Lutetia, or protected by marshes, as at Avaricum, oppida—at once forterices and places of refuge, like the Greek Acropolis—were the cost and ward over the beaten tracks and rivers of the Gauls.

These primitive societies of tall, fair-skinned warriors, red-eyed and red-haired, were gradually organized into political bodies of various kinds—kingdoms, republics and federations—and divided into districts or pays (pays) to which divisions the minds of the country folk have remained faithfully attached ever since. The victorious aristocracy of the kingdom dominated the other classes, strengthened by the prestige of birth, the ownership of the soil and the practice of arms. Side by side with this martial nobility the Druids constituted a priesthood unique in ancient times; neither hereditary as in India, nor composed of isolated priests as in Greece, nor of independent colleges as at Rome, it was a true corporation, which at first possessed great moral authority, though by Caesar's time it had lost both strength and prestige. Beneath these were the common people attached to the soil, the Iberians and Ligurians. Empires of the Celts.
who did not count for much, but who reacted against the insufficient protection of the regular institutions by a voluntary subordination to certain powerful chiefs.

This impotence of the state was a permanent cause of those discords and revolts, which in the 1st century B.C. were so singularly favourable to Caesar's ambition. Thus after eight years of incoherent struggles, of scattered revolts, and then of more and more energetic efforts, Gaul, at last aroused by Vercingetorix, for once concentrated her strength, only to perish at Alesia, vanquished by Roman discipline and struck at from the rear by the conquest of Britain (58–50 B.C.).

This defeat completely altered the destiny of Gaul, and she became one of the principal centres of Roman civilization. Of the vast Celtic empire which had dominated Europe nothing now remained but scattered remnants in the farthest corners of the land, refuges for all those vanquished Gaels, Picts or Gaels; and of its civilization there lingered only idioms and dialects—Gaelic, Pict and Gallic—which gradually dropped out of use. During five centuries Gaul was unalterably loyal to her conquerors; for to conquer is nothing if the conquered be not assimilated by the conqueror, and assimilation was a past-master of this art. The personal charm of Caesar and the prestige of Rome are not of themselves sufficient to explain this double conquest.

The generous and enlightened policy of the imperial administration asked nothing of the people of Gaul but military service and the payment of the tax; in return it freed individuals from patronal domination, the people from oligarchic greed or Druidic excommunication, and every one in general from material anxiety. Petty tyrannies gave place to the great Pax Romana. The Julio-Claudian dynasty did much to attach the Gauls to the empire; they always occupied the first place in the mind of Augustus, and the revolt of the Aeduan Julius Sacrovir, provoked by the census of A.D. 21, was easily repressed by Tiberius. Caligula visited Gaul and founded literary competitions at Lyons, which had become the political and intellectual capital of the country. Claudius, who was a native of Lyons, extended the right of Roman citizenship to many of his fellow-townsmen, gave them access to the magistracy and to the senate, and supplemented the annexation of Gaul by that of the Germanic tribes, which had been conquered. The right announced on this occasion was engraved on tables of bronze at Lyons, and is the first authentic record of Gaul's admission to the citizenship of Rome. Though the crimes of Nero and the catastrophes which resulted from his downfall, provoked the troubles of the year A.D. 70, the revolt of Sabinus was in the main an attempt by the Germans to pillage Gaul and the palaus to military insurrections. The government of the Flavians and the Antonines completed a definite reconciliation. After the extinction of the family of Augustus in the 1st century Gaul had many emperors—Galba, Otho, Vitellius, Vespasian and Domitian; and in the 2nd century she provided Gauls to rule the empire—Antoninus (138–161) came from Nimes and Claudius from Lyons, as did also Caracalla later on (211–217). The romanization of the Gauls, like that of the other subject nations, was effected by slow stages and by very diverse means, furnishing an example of the constant adaptability of Roman policy. It was begun by establishing a network of roads with Lyons as the central point, and by the development of a prosperous urban life in the increasingly wealthy Roman colonies; and it was continued by the disintegration into independent cities of nearly all the Gallo-British states of the Narbonnaise, together with the substitution of the Roman collegial magistracy for the isolated magistracy of the Gaes. This alteration came about more quickly in the north-east in the Rhine-land than in the west and the centre, owing to the near neighbourhood of the legions on the frontiers. Rome was too tolerant to impose her own institutions by force; it was the conquered peoples who collectively and individually solicited as a favour the right of adopting the municipal system, the magistracy, the sacerdotal and aristocratic social system of their conquerors. The edict of Caracalla, at the beginning of the 3rd century, by conferring the right of citizenship on all the inhabitants of the empire, completed an assimilation for which commercial relations, schools, a taste for officialism, and the adaptability and quick intelligence of the race had already made preparation. The Gauls now called themselves Romans and their language Romance. There was neither oppression on the one hand nor servility on the other to explain this abandonment of their traditions. Thanks to the political and religious unity which a common worship of the emperor and of Rome gave them, thanks to administrative centralization tempered by a certain amount of municipal autonomy, Gaul prospered throughout three centuries.

But this stability of the Roman peace had barely been realized when events began to threaten it both from within and without. The Pax Romana having rendered any armed force unnecessary amid a formerly very bellicose people, only eight legions mounted guard over the Rhine to protect it from the barbarians who surrounded the empire. The north was made by the Germanic the eastern frontiers, and the insurrections of the Bagaudae aggravated the death wrought by a grasping treasury and by barbarian incursions; so that the anarchy of the 3rd century soon aroused separatist ideas. Under Postumus Gaul had already attempted to restore an independent short-lived empire (258–267); and twenty-eight years later the tetrarchy of Diocletian proved that the blood now circulated with difficulty from the heart to the extremities of an empire on the eve of disintegration. Rome was to see her universal dominion gradually menaced from all sides. It was in Gaul that the decisive revolutions of the time were first prepared; Constantine's crusades to overthrow the altars of paganism, and Julian's campaigns to set them up again. After Constantine the emperors of the East in the 4th century merely put in an occasional appearance at Rome; they resided at Milan or in the prefectoral capitals of Gaul—at Arles, at Trier (Trier), at Reims or in Paris. The ancient territorial divisions of Belgium, Gallia Lugdunensis (Lyonnaise), Gallia Narbonensis (Narbonnaise)—were split up into seventeen little provinces, which in their turn were divided into two dioceses. Thus the great historic division was made between southern and northern France. Roman nationality persisted, but the administrative system was tottering.

Upon ground that had been so well levelled by Roman legislation aristocratic institutions naturally flourished. From the 4th century onward the balance of classes was disturbed by the development of a landed aristocracy that grew more powerful day by day, and by the corresponding ruin of the small proprietors and industrial and commercial corporations. The members of the curia who assisted the magistrates in the cities, crushed by the burden of taxes, now evaded as far as possible public office or senatorial honours. The vacancies left in this middle class by this continual desertion were not compensated for by the progressive advance of a lower class destitute of personal property and constantly engulfed in the work. The peasants, no less than the industrial labourers, suffered from the absence of any capital laid by, which alone could have enabled them to improve their land or to face a time of bad harvests. Having no credit they sought themselves at the mercy of their neighbours, the great landholders, and by degrees fell into the position of tenants, or into servitude. The curia was thus emptied both from above and from below. It was in vain that the emperors tried to rivet the chains of the curia in this hereditary bondage, by attaching the small proprietor to his glebe, like the artisan to his gild and the soldier to his legion. To such a miserable pretence of freedom they all preferred servitude, which at least ensured them a livelihood; and the middle class of freemen thus became gradually extinct.

FRANCE The Eastern Frontier, 1598-1789
The aristocracy, on the contrary, went on increasing in power, and eventually became masters of the situation. It was through them that the emperor, theoretically absolute, practically carried on his administration; but he was no longer either strong or a divinity, and possessed nothing but the semblance of omnipotence. His official despotism was opposed by the passive but invincible competition of an aristocracy, more powerful than himself because it derived its support from the revived relation of patron and dependants. But though the aristocracy administered, yet they did not govern. They suffered, as did the Empire, from a general state of lassitude. Like their private life, their public life, no longer stimulated by struggles and difficulties, had become sluggish; their power of initiative was enfeebled. Feeling their incapacity they no longer embarked on great political schemes; and the army, the instrument by which such schemes were carried on, was only held together by the force of habit. In this society, where there was no traffic in anything but wealth and ideas, the soldier was nothing more than an agitator or a parasite. The egoism of the upper classes held military duty in contempt, while theiravarice depopulated the countryside, whence the legions returned to the plains of Gaul. A prey to perpetual alarm, the people entrenched themselves behind those high walls of the oppida which Roman security had razed to the ground, but imperial impotence had restored, and where life in the middle ages was destined to vegetate in unrestful isolation.

Amidst this general apathy, intellectual activity alone persisted. In the 4th century there was a veritable renaissance in Gaul, the last outburst of a dying flame, which yet bore witness also to the general decadence. The agreeable versification of an amateur like Ausonius, the refined panegyrics of a Eumenius, disguising nulity of thought beneath elegance of form, already foretold the perilous sterility of scholasticism. Art, so widespread in the wealthy villas of Gaul, contented itself with imitation, produced nothing original and remained mediocre. Human curiosity, no longer concerned with philosophy and science, seemed as though stilled, religious polemics alone continuing to hold public attention. Disinclination for the self-sacrifice of active life and weariness of the things of the earth led natural to absorption in the things of heaven.

After bringing about the success of the Asiatic cults of Mithra and Cybele, these same factors now assured the triumph over exhausted paganism of yet another oriental religion—Christianity—after a duel which had lasted two centuries.

This new faith had appeared to Constantine likely to infuse young and healthy blood into the Empire. In reality Christianity, which had contributed not a little to stimulate the political unity of continental Gaul, now tended to dissolve it by destroying that religious unity which had heretofore been its complement. Before this there had been complete harmony between Church and State; but afterwards came indifference and then disagreement between political and religious institutions, between the City of God and that of Caesar. Christianity, introduced into Gaul during the 1st century of the Christian era by those foreign merchants who traded along the coasts of the Mediterranean, had by the middle of the 2nd century founded communities at Vienne, St. Poitiers, and at Lyons. Their propagandising zeal soon exposed them to the wrath of an antagonistic populace and the contempt of the educated; and thus it was that in A.D. 177, under Marcus Aurelius, the Church of Lyons, founded by St. Poithinus, suffered those persecutions which were the effective cause of her ultimate victory. These Christian communities, disguised under the legally authorized name of burial societies, gradually formed a vast secret cosmopolitan association, superimposed upon Roman society but incompatible with the Empire. Christianity had to be either destroyed or absorbed. The persecutions under Aurelian and Diocletian almost succeeded in accomplishing the former; the Christian churches were saved by the instability of the existing authorities, by military anarchy and by the incursions of the barbarians. Despite tortures and martyrdoms, and thanks to the seven apostles sent from Rome in 250, during the 3rd century their branches extended all over Gaul.

The emperors had now to make terms with these churches, which served to group together all sorts of malcontents, and this was the object of the edict of Milan (313), by which the Church, at the outset simply a Jewish institution, was naturalized as Roman; while in 325 the Council of Nicolas endowed her with unity. But for the security and the power thus attained she had to pay with her independence. On the other hand, pagan and Christian elements in society existed side by side without intermingling, and even openly antagonistic to each other—one aristocratic and the other democratic. In order to induce the masses of the people once more to become loyal to the imperial form of government the emperor Julian tried by founding a new religion to give its functionaries a religious prestige which should impress the popular mind. His plan failed; and the emperor Theodosius, aided by Ambrose, bishop of Milan, preferred to make the Christian clergy into a body of imperial and conservative officials; while in return for their adhesion he abolished the Arian heresy and paganism itself, which could not survive without his support. At the end of the 4th century the nominal independence which the Church still possessed north of the Alps had entirely disappeared.

In Gaul the most famous leader of this first merciless, if still perilous crusade, was a soldier-monk, Saint Martin of Tours. Thanks to him and his disciples in the middle of the 4th century and the beginning of the 5th many of the towns possessed well-established churches; but the militant ardour of monks and centuries of labour were needed to conquer the country districts, and in the meantime both dogma and internal organization were subjected to important modifications. As regards the former the Church adopted a course midway between metaphysical explanations and historical traditions, and reconciled the more extreme theories; while with the admission of pagans a great deal of paganism itself was introduced. On the other hand, the need for political and social order involved the necessity for a disciplined and homogeneous religious body; the exercise of power, moreover, soon transformed the democratic Christianity of the earlier churches into a federation of little conservative monarchies. The increasing number of her adherents, and her inexpérience of government on such a vast and complicated scale, obliged her to comply with political necessity and to adopt the system of the state and its social customs. The Church was no longer a fraternity, on a footing of equality, with freedom of belief and tentative as to dogma, but an authoritative aristocratic hierarchy. The episcopate was now recruited from the great families in the same way as the imperial and the municipal public services. The Church called on the emperor to convokwe and preside over her councils and to combat heresy; and in order more effectually to crush the latter she replaced primitive independence and local diversity by uniformity of doctrine and worship, and by the hierarchy of dioceses and ecclesiastical provinces. The heads of the Church, her bishops, her metropolitans, took the titles of their pagan predecessors as well as their places, and their jurisdiction was enforced by the laws of the state. Rich and powerful chiefs, they were administrators as much as priests: St. Ambrose (c. 340), bishop of Milan (d. 397), St. Eucherius of Lyons (d. 450), Apollinaris Sidonius of Clermont (d. c. 490) assumed the leadership of society, led the poor, levied tithes, administered justice, and in the towns where they resided, surrounded by priests and deacons, ruled both in temporal and spiritual matters.

But the humiliation of Theodosius before St. Ambrose proved that the emperor could never claim to be a pontiff, and that the dogma of the Church remained independent of the sovereign as well as of the people; if she sacrificed her liberty it was but to claim it again and maintain it more effectively amid the general languor. The Church thus escaped the unpopularity of this decadent empire, and during the 5th century she provided a refuge for all those who, wishing to preserve the Roman unity, were terrified...
by the blackness of the horizon. In fact, whilst in the Eastern Church the metaphysical ardour of the Greeks was spending itself in terrible combats in the ecumenical councils over the interpretation of the Nicene Creed, the clergy of Gaul, more simple and strict in their faith, adhered these theological logomachies; from the first they had preferred action to criticism and had taken no part in the great controversy on free-will raised by Pelagius. Another kind of warfare was about to absorb their whole attention; the barbarians were attacking the frontiers of the Empire on every side, and their advent once again modified Gallo-Roman civilization.

For centuries they had been silently massing themselves around ancient Europe, whether Iberian, Celtic or Roman. Many times already during that evening of a decadent civilization, their threatening presence had seemed like a dark cloud veiling the radiant sky of the peoples established on the Mediterranean seaboard. The cruel lightning of the sword of Brennus had illumined the night, setting Rome or Delphi on fire. Sometimes the storm had burst over Gaul, and there had been need of a Marius to stem the torrent of Cimbri and Teutons, or of a Caesar to drive back the invasions into their mountains. Sometimes, on the other hand, the horizon would clear again, until some such disaster as that which befell Varus would come to mortify cruelly the pride of an Augustus. The Romans had soon abandoned hope of conquering Germany, with its fluctuating frontiers and nomadic inhabitants. For more than two centuries they had remained prudently entrenched behind the earthworks that extended from Cologne to Katisbon (Regensburg); but the intestine feuds which prevailed among the barbarians and were fostered by Rome, the organization under bold and turbulent chiefs of the bands greedy for booty, the pressing forward on populations already settled of tribes in their rear; all this caused the Germanic invasion to filter by degrees across the frontier. It was the work of several generations and took various forms, by turns and simultaneously colonization and aggression; but from this time forward the *pax romana* was at an end. The emperors Probus, Constantine, Julian and Valentinian, themselves foreigners, were worn out with repulsing these repeated assaults, and the general enervation of society did the rest. The barbarians gradually became part of the Roman population; they permeated the army, until after Theodosius they recruited it exclusively; they permeated civilian society as colonists and agriculturists, till the command of the army and of important public duties was given over to a Silicho or a Crocus. Thus Rome allowed the wolves to mingle with the dogs in watching over the flock, just at a time when the civil wars of the 4th century had denuded the Rhenish frontier of troops, whose numbers had already been diminished by Constantine. Then at the beginning of the 5th century, during a furious eruption of Germans fleeing before Huns, the *limes* was carried away (406-407); and for more than a hundred years the torrent of fugitives swept through the Empire, which retreated behind the Alps, there to breathe its last.

While for ten years Alaric's Goths and Stilicho's Vandals were drenching Italy with blood, the Vandals and the Alani from the steppes of the Black Sea, dragging in their wake the reluctant German tribes who had been allies of Rome, and who had already settled down to the cultivation of their lands, invaded the now abandoned Gaul, and having come as far as the Pyrenees, crossed over them. After the passing of this torrent the Visigoths, under their king Ataulphus, Wallia and Theodoric, still dazzled by the splendours of this immense empire, established themselves like submissive vassals in Aquitaine, with Toulouse as their capital. About the same time the Burgundians settled even more peacefully in Rhenish Gaul, and, after 456, to the west of the Jura in the valleys of the Saône and the Rhone. The original Franks of Germany, already established in the Empire, and pressed upon by the same Huns who had already forced the Goths across the Danube, passed beyond the Rhine and occupied north-eastern Gaul; Ripuarians of the Rhine establishing themselves on the Sambre and the Meuse, and

Salians in Belgium, as far as the great fortified highroad from Bavai to Cologne. Accepted as allies, and supported by Roman prestige and by the active authority of the general Aetius, all these barbarians rallied round him and the Romans of Gaul, and in 451 defeated the hordes of Attila, who had advanced as far as Orleans, at the great battle of the Cataluan plains.

Thus at the end of the 5th century the Roman empire was nothing but a heap of ruins, and fidelity to the empire was now only maintained by the Catholic Church; she alone survived, as rich, as much honoured as ever, and more powerful, owing to the disappearance of the imperial officials for whom she had found substitutes, and the decay of the municipal bodies into whose inheritance she had entered. Owing to her the City of God gradually replaced the Roman imperial polity and preserved its civilization; while the Church allied herself more closely with the new kingdoms than she had ever done with the Empire. In the Gothic or Burgundian states of the period the bishops, after having for a time the barbarian invaders, sought and obtained from their chief the support formerly received from the emperor. Apollinarius Sidonius paid court to Stilicho, as the independent king of the Visigoths, against whom he declared war; and Avitus, bishop of Vienne, was graciously received by Gundihald, king of the Burgundians. But these princes were Arians, i.e. foreigners among the Catholic population; the alliance sought for by the Church could not reach her from that source, and it was from the rude and pagan Franks that she gained the material support which she still lacked. The conversion of Clovis was a master-stroke: it was fortunate both for himself and for the Franks. Unity in faith brought about unity in law.

Clovis was king of the Sicambrians, one of the tribes of the Salian Franks. Having established themselves in the plains of Northern Gaul, but driven by the necessity of finding new land to cultivate, in the days of their king Childeric they had descended into the fertile valleys of the Somme and the Oise. Clovis's victory at Soissons over the last troops left in the service of Rome (486) extended their settlements as far as the Loire. By his conversion, which was due to his wife Clotilda and to Remigius, bishop of Reims, more than to the victory of Tolbiac over the Alamanni, Clovis made definitely sure of the Roman inhabitants and gave the Church an army (496). Thenceforward he devoted himself to the foundation of the Frankish monarchy by driving the exhausted and demoralized heretics out of Gaul, and by putting himself in the place of the now enfeebled emperor. In 500 he conquered Gundihald, king of the Burgundians, reduced him to a kind of vassalage, and forced him into reiterated promises of conversion to orthodoxy. In 507 he conquered and killed Alaric II., king of the Arian Visigoths, and drove the latter into Spain. Legend adorns his campaign in Aquitaine with miracles; the bishops were the declared allies of both him and his son Theuderich (Thierry) after his conquest of Auvergne. At Tours he received from the distant emperor at Constantinople the diploma and insignia of *patriicus* and Roman consul, which legalized his military conquests by putting him in possession of civil powers. From this time forward a great historic transformation was effected in the eyes of the bishops at Tours. The Gallo-Romans: the Frankish chief took the place of the ancient emperors. Instead of blaming him for the murder of the lesser kings of the Franks, his relatives, by which he had accomplished the union of the Frankish tribes, they saw in this the hand of God rewarding a faithful soldier and a converted pagan. He became their king, their new David, as the Christian emperors had formerly been; he built churches, endowed monasteries, protected St Vaast (Vedastus, d. 540), first bishop of Arras and Cambrai, who restored Christianity in northern Gaul. Like the emperors before him Clovis, too, reigned over the Church. Of his own authority he called together a council at Orleans in 511, the year of his death. He was already the grand distributor of ecclesiastical benefices, pending the time when his successors were to confirm the episcopal elections, and his power began to take
on a more and more absolute character. But though he felt the ascendant influence of Christian teaching, he was not really penetrated by its spirit; a professing Christian, and a friend to the episcopate, Clovis remained a barbarian, crafty and ruthless. The bloody tragedies which disfigured the end of his reign bear sad witness to this; they were a fit prelude to that period during the course of which, as Gregory of Tours said, "barbarism was let loose."

The conquest of Gaul, begun by Clovis, was finished by his sons: Theuderich, Chlodomer, Childerich and Clotaire. In three successive campaigns, from 523 to 532, they annihilated the Burgundian kingdom, which had maintained its independence, and had endured for nearly a century. Favoured by the war between Justinian, the East Roman emperor, and Theodoric's Ostrogoths, the Frankish kings divided Provence among them as they had done in the case of Burgundy. Thus the whole of Gaul was subjected to the sons of Clovis, except Septimania in the south-east, where the Visigoths still maintained their power. The Frankish armies then overfl owed into the neighbouring countries and began to pillage them. Their disorderly cohorts made an attack upon Italy, which was repulsed by the Lombards, and another on Spain with the same want of co-ordination, and they prevented the conquest of Germany, where Clovis had already reduced to submission the country on the banks of the Maine, later known as Franconia. In 531 the Thuringians in the centre of Germany were brought into subjection by his eldest son, King Theuderich, and about the same time the Bavarians were united to the Franks, though preserving a certain autonomy. The Merovingian monarchy thus attained the utmost limits of its territorial expansion, bounded as it was by the Pyrenees, the Alps and the Rhine; it exercised influence over the whole of Germany, which it threw open to the Christian missionaries, and its conquests formed the first beginnings of German history.

But to these wars of aggrandizement and pillage succeeded those fratricidal struggles which disgraced the whole of the sixth century and arrested the expansion of the Merovingian power. When Clotaire, the last surviving son of Clovis, died in 561, the kingdom was divided between his four sons like some piece of private property, as in 521, and according to the German method. The capitals of these four kings—Charibert, who died in 567; Guntram, Sigebert and Chilperic—were Chalon, Orleans, Reims and Sens, the former, and north and north of the Loire, where the Germanic inhabitants predominated; but their respective boundaries were so confused that disputes were inevitable. There was no trace of a political idea in these disputes; the mutual hatred of two women aggravated jealousy to the point of causing terrible civil wars from 561 to 613, and these finally created a national conflict which resulted in the dismemberment of the Frankish empire. Recognized, in fact, already as separate provinces were Austrasia, or the eastern kingdom, Neustria, or north-west Gaul and Burgundy; Aquitaine alone was as yet undifferentiated.

Sigebert had married Brunhilda, the daughter of a Visigoth king; she was beautiful and well educated, having been brought up in Spain, where Roman civilization still flourished. Chilperic had married Galswintha, one of Brunhilda's sisters, for the sake of her wealth; but despite this marriage he had continued his amours with a waiting-woman named Fredegund, who pushed ambition to the point of crime, and she induced him to get rid of Galswintha. In order to avenger her sister, Brunhilda incited Sigebert to begin war, which terminated the life of Sigebert by Fredegund at the very moment when, thanks to the help of the Germans, he had gained the victory, and with the imprisonment of Brunhilda at Rouen. Fredegund subsequently caused the death of Merovech (Mérovedé), the son of Chilperic, who had been secretly married to Brunhilda, and that of Bishop Praetextatus, who had solemnized their union. After this, Fredegund endeavoured to restore imperial finance to a state of solvency, and to set up a more regular form of government in her Neustria, which was less romanized and less wealthy than Burgundy, where Guntram was reigning, and less turbulent than the eastern kingdom, where most of the great warlike chiefs with their large landed estates were somewhat impatient of royal authority. But the accidental death of two of her children, the assassination of her husband in 584, and the advice of the Church, induced her to make overtures to her brother-in-law Guntram. A lover of peace through sheer cowardice, and as depraved in his morals as Chilperic, Guntram had played a vacillating and purely self-interested part in the family tragedy. He declared himself the protector of Fredegund, but his death in 593 delivered up Burgundy and Neustria to Brunhilda's son Childerich, king of Austrasia, in consequence of the treaty of Andelot, made in 587. An ephemeral triumph, however; for Childerich died in 596, followed a year later by Fredegund.

The fall of Brunhilda. The whole of Gaul was now handed over to three children: Childerich's two sons, Theuderich and Theuderic (Thierry), and the son of Fredegund, Clotaire II. The latter, having vanquished the two former at Latofano in 596, was in turn beaten by them at Dormelles in 600, and a year later a fresh fratricidal struggle broke out between the two grandsons of the aged Brunhilda. Theuderich joined with Clotaire against Theuderic, and invaded his brother's kingdom, in which, though on the borders of Neustria, his army, composed of Saxons and Thuringians, strode again in 613 in consequence of Theuderich's desire to join Austrasia to Neustria, but his death delivered the kingdoms into the hands of Clotaire II. This weak king leaned for support upon the nobles of Burgundy and Austrasia, impatient as they were of obedience to a woman and the representative of Rome. The ecclesiastical party also abandoned Brunhilda because of her persecution of their saints, after which Clotaire, having now got the upper hand, thanks to the defection of the Austrasian nobles, of Arnulf, bishop of Metz, with his brother Pipinn, and of Warnacharic, mayor of the palace, made a terrible end of Brunhilda in 613. Her long reign had not lacked intelligence and even greatness; she alone, amid all these princes, warred by self-indulgence or weakened by discord, had behaved like a statesman, and she alone understood the obligations of the government she had inherited. She wished to abolish the fatal tradition of dividing up the kingdom, which so constantly prevented any possible unity; in opposition to the nobles she used her royal authority to maintain the Roman principality of Neustria and regular administration. Toward the Church she held a courteous and agreeable policy, renewing relations between the Frankish kingdom and the pope; and she so far maintained the greatness of the Empire that tradition associated her name with the Roman roads in the north of France, entitling them "les chaussées de Brunhaut."

Like his grandfather, Clotaire II. reigned over a once more united Gaul of Franks and Gallo-Romans, and like Clovis he was not too well obeyed by the nobles; moreover, his had been a victory more for the aristocracy than for the crown, since it limited the power of the latter.

Not that the permanent constitution of the 18th of October 614 was of the nature of an anti-monarchical revolution, for the royal power still remained very great, decked itself with the pompous titles of the Empire, and continuing to be the dominant institution; but the reservations which Clotaire II. had to make in conceding the demands of the bishops and great lamen show the extent and importance of the concessions these latter were already aiming at. The bishops, the real inheritors of the imperial idea of government, had become great landowners through the barbarian propensity for the landed estates, and allied as they were to the aristocracy, whence their ranks were commonly recruited, they had gradually identified themselves with the interests of their class and had adopted its customs; while thanks to long minorities and civil wars the aristocracy of the high officials had taken an equally important social position. The treaty of Andelot in 587 had already decided that the benefits or lands granted to them by the kings should be held for life. In the 7th century the Merovingian kings adopted the custom of summoning them all, and not merely the officials of their Palatium, to discuss political affairs; they began, moreover,
to choose their counts or administrators from among the great landholders. This necessity for approval and support points to yet another alteration in the nature of the royal power, absolute as it was in theory.

The Mayoralty of the Palace aimed a third and more serious blow at the royal authority. By degrees, the high officials of the Palatium, whether secular or ecclesiastical, and also the provincial counts, had rallied round the mayors of the palace as their real leaders. As under the Empire, the Palatium was both royal court and centre of government, with the same bureaucratic hierarchy and the same forms of administration; and the mayor of the palace was premier official of this itinerant court and ambulatory government. Moreover, since the palace controlled the whole of each kingdom, the mayors gradually extended their official authority so as to include functionaries and agents of every kind, instead of merely those attached immediately to the king's person. They suggested candidates for office for the royal selection, often appointed office-holders, and, by royal warrant, supported or condemned them. Mere subordinates were the royal bodyguard who was notorious to the frequent minorities, and to civil wars which broke the tradition of obedience, the all-powerful ministers of kings nominally absolute but without any real authority. Before long they ceased to claim an even greater degree of independence than that of Warnachaire, who forced Clotaire II. to swear that he should never be deprived of his mayoralty of Burgundy; they wished to take the first place in the kingdoms they governed, and to be able to attack neighbouring kingdoms on their own account. A struggle, motivated by self-interest, no doubt; but a struggle, too, of opposing principles. Since the Frankish monarchy was now in their power some of them tried to re-establish the unity of that monarchy in all its integrity, together with the superiority of the State over the Church; others, faithless to the idea of unity, saw in the disintegration of the state and the supremacy of the nobles a warrant for their own independence. These two tendencies were destined to strive against one another during an entire century (613–714), and to occasion two periods of violent conflict, which, divided by a kind of renascence of royalty, were to end at last in the triumphant substitution of the Austrasian mayors for royalty and aristocracy alike.

The first struggle began on the accession of Clotaire II., when Austrasia, having had a king of her own ever since 561, demanded one now. In 623 Clotaire was obliged to send her his son Dagobert and even to extend his territory. But in Dagobert’s name two men ruled, representing the union of the official aristocracy and the Church. One, Pippin of Landen, derived his power from his position as mayor of the palace, from great estates in Aquitaine and between the Meuse and the Rhine, and from the immense number of his supporters; the other, Arnulf, bishop of Metz, sprang from a great family, probably of Roman descent, and was besides immensely wealthy in worldly possessions. By the union of their forces Pippin and Arnulf were destined to shape the future. They had already, in 613, treated with Clotaire and betrayed the hopes of Brunhilda, being consequently rewarded with the guardianship of young Dagobert. Burgundy followed the example of Austrasia; demanded the abolition of the mayoralty, and in 627 succeeded in obtaining her independence of Neustria and Austrasia and direct relations with the king.

The death of Clotaire (639) was the signal for a revival of the royal power. Dagobert deprived Pippin of Landen of his authority and forced him to fly to Aquitaine; but still he had to give the Austrasians his son Sigebert III. for their king (644). He made administrative progress through Neustria and Burgundy to recall the nobles to their allegiance, but again he was forced to designate his second son Clodoveus as king of Neustria. He did subdue Aquitaine completely, thanks to his brother Charibert, with whom he had avoided dividing the kingdom, and he tried to restore his own demesne, which had been despoiled by the granting of benefices or by the pious frauds of the Church. In short, this reign was one of great conquests, impossible except under a strong government. Dagobert’s victories over Samo, king of the Slavs along the Elbe, and his subjugation of the Bretons and the Basques, maintained the prestige of the Frankish empire; while the luxury of his court, his taste for the fine arts (ministered to by his treasurer Eligius 1), his numerous achievements in architecture—especially the abbey of St Denis, burial-place of the kings of France—the brilliance and the power of the churchmen who surrounded him and his revision of the Salic law, ensured for his reign, in spite of the failure of his plans for unity, a fame celebrated in folksong and ballad.

But for barbarous nations old-age comes early, and after Dagobert’s death (649), the monarchy went swiftly to its doom. The mayors of the palace again became supreme, and the kings not only ceased to appoint them, but might not even remove them from office. Such mayors—do-nothing kings—were Aega and Erchinoald, in Neustria, Pippin and Otto in Austrasia, and Flochot in Burgundy. One of them, Grimold, son of Pippin, actually dared to take the title of king in Austrasia (649). This was a premature attempt and bore no result, yet it was significant; and not less so is the fact that these mayors bore rule was a huge association of great personages—men and ecclesiastics who seem to have had much more independence than in the 6th century. We find the dukes actually raising troops without the royal sanction, and even against the king. In 641 the mayor Flochot was forced to swear that they should hold their offices for life; and though these offices were not yet hereditary, official dynasties, as it were, began to be established permanently within the palace. The crown lands, the governments, the different offices, were looked upon as common property to be shared between themselves. Organized into a compact body they surrounded the king and were far more powerful than he. In the general assembly of its members this body of officials decided the selection of the mayor; it presented Flochot to the choice of Queen Nanthilda, Dagobert’s widow; after long discussion it appointed Ebroin as mayor; it submitted requests that were in reality commands to the Assembly of Bonneil in 656 and later to Chiléric in 670. Moreover, the countries formerly subdued by the Franks availed themselves of this opportunity to loosen the yoke; Thuringia was lost by Sigebert in 641, and the revolt of Alamanni in 643 set back the frontier of the kingdom from the Elbe to Austrasia. Aquitaine, hitherto the common prey of all the Frankish kings, having in vain tried to profit by the struggles between Fredegond and Brunhilda, and set up an independent king, Gondibald, now finally burst her bonds in 670. Then came a time when the kings were mere children, honoured with but the semblance of respect, under the tutelage of a single mayor, Erbroin of Neustria.

This representative of royalty, chief minister for four-and-twenty years (656–681), attempted the impossible, endeavouring to re-establish unity in the midst of general dissolution and to maintain intact a royal authority usurped everywhere by the hereditary power of the great palatine families. He soon stirred up against himself all the dissatisfied nobles, led by Léger (Leodegarius), bishop of Autun, his chief rival in Burgundy. Clotaire III.‘s death gave the signal for war. Erbroin’s enemies set up Chiléric II. in opposition to Theuderich, the king whom he had coveted without summoning the great provincial officials. Despite a temporary triumph, when Chiléric was forced to recognize the principle of hereditary succession in public offices, and when the mayoralities of Neustria and Burgundy were alternated to the profit of both, Léger soon fell into disgrace and was exiled to that very monastery of Luxeuil to which Erbroin had been relegated. Chiléric having regained the mastery restored the mayor’s office, which was immediately disputed by the two rivals; Erbroin was successful and established himself as mayor of the palace in the room of Leudesium, a partisan of Léger (675).

1 St Eligius, bishop of Noyon, apostle of the Belgians and Frisians (d. 6597).
Immunity was the direct and personal privilege which forbade any royal official or his agents to decide cases, levy taxes, or to exercise any administrative control on the domains of a bishop, an abbey, or one of the great secular nobles. On thousands of estates the royal government gradually allowed the law of the land to be superseded by local law, and public taxation to change into special contributions; so that the duties of the lower classes towards the state were transferred to the great landlords, who thus became loyal adherents of the king but absolute masters on their own territory. The Merovingians had no idea that they were abdicating the least part of their authority, nevertheless the deprivations acquired by the feebler kings led of necessity to the diminution of their authority and their judicial powers, and to the abandonment of public taxation. They thought that by granting immunity they would strengthen their direct control; in reality they established the local independence of the great landowners, by allowing royal rights to pass into their hands. Then came confusion between the rights of the sovereign and the rights of property. The administrative machinery of the state still existed, but it worked in emptiness as its taxpayers disappeared, those who were amenable to its legal jurisdiction slipped from its grasp, and the number of those whose affairs it should have directed dwindled away. Thus the Merovingians had shown themselves incapable of rising above the barbarous notion that royalty is a personal asset to the idea that royalty is of the state, a power belonging to the nation and instituted for the benefit of all. They represented in society nothing more than a force which grew feebler and feebler as other forces grew strong; they never stood for a national magistracy.

Society no less than the state was falling asunder by a gradual process of decay. Under the Merovingians it was a hierarchy wherein grades were marked by the varied scale of the *vogelstok*, a man being worth anything from thirty to six hundred gold pieces. The different degrees were those of slave, freedman, tenant-farmer and great landowner. As in every social scheme where the government is without real power, the weakest sought protection of the strongest; and the system of patron, client and journeyman, which had existed among the Romans, the Gauls and the Germans, spread rapidly in the 6th and 7th centuries, owing to public disorder and the inadequate protection afforded by the government. The Church’s patronage provided some with a refuge from violence; others ingratiated themselves with the rich for the sake of shelter and security; others again sought place and honour from men of power; while women, churchmen and warriors alike claimed the king’s direct and personal protection.

This hierarchy of persons, these private relations of man to man, were recognized by custom in default of the law, and were soon strengthened by another and territorial hierarchy. The large estate, especially if it belonged to the Church, very soon absorbed the few fields of the freeman. In order to farm these, the Church and the rich landowners granted back the holdings on the temporary and conditional terms of tenancy-at-will or of the *beneficium*, thus merely allowing endlessly the land subject to their overlordship and the men who were dependent upon them as tenants. The kings, like private individuals and ecclesiastical establishments, made use of the *beneficium* to reward their servants; till finally their demesne was so reduced by these perpetual grants that they took to distributing among their champions land owning the overlordship of the Church, or granted their own lands for single lives only. These various “*beneactions*” were, as a rule, merely the indirect methods which the great landowners employed in order to absorb the small proprietor. And so well did they succeed, that in the 6th and 7th centuries the provincial hierarchy consisted of the cultivator, the holder of the *beneficium* and the owner; while this dependence of one man upon another affected the personal liberty of a large section of the community, as well as the condition of the land. The great landowner tended to become not only lord over his tenants, but also himself a vassal of the king.
Thus by means of immunities, of the beneficium and of patronage, society gradually organized itself independently of the state, since it required further security. Such extra security was first provided by the conqueror of

Pippin of Herstal.

Territory; for Pippin II. represented the two great families of Pippin and of Arnulf, and consequently the interests then paramount, i.e. land and religion, while he had at his back a great company of followers and vast landed estates.

For forty years (615-655) the office of mayor of Austrasia had gone down in his family almost continuously in direct descent from father to son. The death of Grimoald had caused the loss of this post, yet Ansegisus (Asegisul), Arnulf's son and Pippin's son-in-law, had continued to hold high office in the Austrasian palace; and about 680 his son, Pippin II., became master of Austrasia, although he had held no previous office in the palace. His dynasty was destined to supplant that of the Merovingian house.

Pippin of Herstal was a pioneer; he was the man who began all that his descendants were afterwards to carry through. Thus he gathered the nobles about him by virtue of his position, but because of his own personal prowess, and because he could assure them of justice and protection; instead of being merely the head of the royal palace he was the absolute lord of his own followers. Moreover, he no longer bore the title of mayor, but that of duke or prince of the Franks, and the majority, like the royal power, was now reduced to a shadow, because his military prowess from which Pippin could bestow upon his sons. The reigns of Theuderich III., Clovis III, or Childerich III., are of no significance except as serving to date charters and diplomas. Pippin II. was the administrator of justice in Austrasia, appointed officials and distributed dukedoms; and it was Pippin II., the military leader, who defended the frontiers threatened by Frisians, Alamanni and Bavarians. Descended as he was from Arnulf, bishop of Metz, he was before all things a churchman, and behind his armies marched the missionaries to whom the Carolingian dynasty, of which he was the founder, were to subject all Christendom. Pippin II. was, in short, who governed, who set in order the social confusions of Neustria, who, after long wars, put a stop to the malpractices of the dukes and counts, and summoned councils of bishops to make good regulations.

But at his death in 714 the child-king Dagobert III. found himself subordinated to Pippin II.'s two grandsons, who, being minors, were under the wardship of their grandmother Plectrude.

Pippin's work was almost undone—a party among the Neustrians under Ragnfrid, mayor of the palace, revolted against Pippin II.'s adherents, and Radbod, duke of the Frisians, joined them. But the Austrasians appealed to an illegitimate son of Pippin, Charles Martel, who had escaped from the prison to which Plectrude, alarmed at his prowess, had consigned him, and took him for their leader. With Charles Martel begins the great period of Austrasian history. Faithful to the traditions of the Austrasian mayors, he chose kings for himself—Clothaire IV., then Childeric II. and lastly Theuderich IV. After Theuderich's death (737) he left the throne vacant until 742, but he himself was king in all but name; he presided over the royal tribunals, appointed the royal officers, issued edicts, disposed of the funds of the treasury and the churches, conferred immunities upon adherents, who were no longer the king's nobles but his own, and even appointed the bishops, though there was nothing of the ecclesiastic about himself. He decided questions of war and peace, and re-established unity in Gaul by defeating the Neustrians and the Aquitanian followers of Duke Odo (Eudes) at Vincy in 717. When Odo, brought to bay, appealed for help to the Arab troops of Abdar Rahin, who after conquering Spain had crossed the Pyrenees, Charles, like a second Clovis, saved Catholic Christendom in its peril by crushing the Arabs at Tours (732). The retreat of the Arabs, who were further weakened by religious disputes, enabled him to restore Frankish rule in Aquitaine in spite of Hunald, son of Odo. But Charles's longest expeditions were made into Germany, and in these he sought the support of the Church, then

the greatest of all powers since it was the depositary of the Roman imperial tradition.

No less unconscious of his mission than Clovis had been, Charles Martel also was a soldier of Christ. He protected the missionaries who paved the way for his militant invasions. Without the apostles of Germany, the English monk Boniface, would never have succeeded in preserving the purity of the faith and keeping the bishops submissive to the Holy See. The help given by Charles had two very far-reaching results. Boniface was the instrument of the union of Rome and Germany, of which union the Holy Roman Empire in Germany was in the 10th century to become the most perfect expression, continuing up to the time of Luther. And Boniface also helped on the alliance between the papacy and the Carolingian dynasty, which, more momentous even than that between Clovis and the bishops of Gaul, was to sanctify might by right.

This union was imperative for the bishops of Rome if they wished to establish their supremacy, and their care for orthodoxy by no means excluded all desire of domination. More religious authority did not secure to them the obedience of either the faithful or the clergy; moreover, they had to consider the great secular powers, and in this respect their temporal position in Italy was growing unbearable. Our relations with the East had been re-established (solemnly of the world after the Roman Senate had set the imperial insignia to Constantinople in 476) were confined to receiving insults from him or suspecting him of heresy. Even in northern Italy there was no longer any opposition to the progress of the Lombards, the last great nation to be established towards the end of the 6th century within the ancient Roman empire—their king Liudprand clearly intended to seize Italy and even Rome itself. Meanwhile from the south attacks were being made by the rebel dukes of Spoleto and Beneventum. Pope Gregory III. cherished dreams of an alliance with the powerful duke of the Franks, as St Remigius before him had thought of uniting with Clovis against the Goths. Charles Martel had protected Boniface on his German missions: he would perhaps lend Gregory the support of his armies. But the warrior, like Clovis aforetime, hesitated to put himself at the disposal of the priest. When it was a question of winning followers or keeping them, he had not scrupled to lay hands on ecclesiastical property, nor to fill the Church with his friends and kinsfolk and, this alliance might embarrass him. So if he loaded the Roman ambassadors with gifts in 730, he also the less remembered that these had been the very band that had driven the Saracens from Provence. However, he died soon after this, on the 22nd of October 741, and Gregory III. followed him almost immediately.

Feeling his end near, Charles, before an assembly of nobles, had divided his power between his two sons, Carloman and Pippin III. The royal line seemed to have been forgotten for six years, but in 742 Pippin brought a son of Childeric II. out of a monastery and made him king. This Childeric III. was but a shadow—and knew it. He made a phantom appearance once every spring at the opening of the great annual national convention known as the Campus Martius (Champ de Mars): a dumb idol, his chariot drawn in leisurely fashion by oxen, he disappeared again into his palace or monastery. An unexpected event re-established unity in the Carolingian family. Pippin's brother, the pious Carloman, became a monk in 747, and Pippin, now sole ruler of the kingdom, ordered Carlod to cut off his royal locks; after which, being king in all but name, he adopted that title in 752. Thus ended the revolution which had been going on for two centuries. The succession of Gregory III. Pippin's illegitimate brother, who, with the help of all the enemies of the Franks—Alamanni, Aquitanians and Bavarians—had disputed his power, now completed the work of centralization, and Pippin had only to maintain it. For this the support of the Church was indispensable, and Pippin understood the advantages of such an alliance better than Charles Martel. A son of the Church, a protector of bishops, a president of councils, a collector of relics, devoted to Boniface
WHOSE HE was appointed, as papal legate, to reform the clergy of Austrasia, he astutely accepted the new claims of the vicar of St Peter to the headship of the Church, perceiving the value of an alliance with this rising power.

Prudent enough to fear resistance if he usurped the Merovingian crown, Pippin the Short made careful preparations for his accession, and discussed the question of the dynasty with Pope Zacharias. Receiving a favourable opinion, he had himself anointed and crowned by Boniface in the name of the bishops, and was then proclaimed king in an assembly of nobles, counts and bishops at Soissons in November 751. Still, certain disturbances made him see that aristocratic approval of his kingship might be strengthened if it could claim a divine sanction which no Merovingian had ever received. Two years later, therefore, he demanded a consecration of his usurpation from the pope, and in St Denis on the 28th of July 754 Stephen II. crowned and anointed not only Pippin, but his wife and his two sons as well.

The political results of this custom of coronation were all-important for the Carolingians, and later for the first of the Capets. Pippin was hereby invested with new dignity, and when Boniface’s anointing had been confirmed by that of the pope, he became the head of the Frankish Church, the equal of the pope. Moreover, he astutely contrived to extend his prielege to his whole family; his royalty was no longer merely a military command or a civil office, but became a Christian priesthood. This sacred character was also conferred gratuitously. On the very day of his coronation Pippin allowed himself to be proclaimed patron of the Romans by the pope, just as Clovis had been made consul. This title of the imperial court was purely honorary, but it attached him still more closely to Rome, though without lessening his independence. He had besides given a written promise to defend the Church of Rome, and that not against the Lombards only. Qualified by letters of the papal chancery as “liberator and defender of the Church,” his armies (754-756) crossed the Alps, despite the opposition of the Frankish aristocracy, and forced Aistulf, king of the Lombards, to cede to him the exarchate of Ravenna and the Pentapolis. Pippin gave them back to Pope Stephen II., and by this famous donation founded that temporal power of the popes which was to endure until 1870. He also dragged the Western clergy into the pope’s quarrel with the emperor at Constantinople, by summoning the council of Gentilly, at which the iconoclastic heresy was condemned (767). Matters being thus settled with Rome, Pippin again took up his wars against the Saxons, against the Arabs (whom he drove from Narbonne in 758), and again against the Franks. He was, dukes of Aquitaine and his ally, duke Tassilo of Bavaria. This last war was carried on systematically from 760 to 768, and ended in the death of Waifer and the definite establishment of the Frankish hold on Aquitaine. When Pippin died, aged fifty-four, on the 24th of September 768, the whole of Gaul had submitted to his authority.

Pippin left two sons, and before he died he had, with the consent of the dignitaries of the realm, divided his kingdom between them, making the elder, Charles (Charlemagne), king of Austrasia, and giving the younger, Carloman, Burgundy, Provence, Septimania, Alsace and Alaminia, and half of Aquitaine to each. On the 9th of October 768 Charles was enthroned at Noyon in solemn assembly, and Carloman at Soissons. The Carolingian sovereignty was thus neither hereditary nor elective, but was handed down by the will of the reigning king, and by a solemn acceptance of the future king on the part of the nobles. In 771 Carloman, with whom Charles had had disputes, died, leaving sons; but bishops, abbots and counts all declared for Charles, save a few who took refuge in Italy with Desiderius, king of the Lombards. Desiderius, whose daughter Bertha or Desidiera, Charles, despite the pope, had married at the instance of his mother Berthe, supported the rights of Carloman’s sons, and threatened Pope Adrian in Rome itself after he had despoiled him of Pippin’s territorial gift. At the pope’s appeal Charles crossed the Alps, took Verona and Pavia after a long siege, assumed the iron crown of the Lombard kings (July 774), and made a triumphal entry to Rome, which had not formed part of the pope’s desires. Pippin’s donation was restored, but the protectorate was no longer so distant, respectful and intermittent as the pope liked.

After the departure of the imperious conqueror, a fresh revolt of the Lombards of Beneventum under Arichis, Desiderius’s son-in-law, supported by a Greek fleet, obliged Pope Adrian to write fresh entreaties to Charlemagne; and in two campaigns (776-777) the latter conquered the whole Lombard kingdom. But another of Desiderius’s daughters, married to the powerful duke Tassilo of Bavaria, urged her husband to avenge her father, now imprisoned in the monastery of Corbie. After endless intrigues, however, the duke, hemmed in by three different armies, had in his turn to submit (788), and all Italy was now subject to Charlemagne. These wars in Italy, even the fall of the Lombard kingdom and the recapture of the duchy of Bavaria, were merely episodes: Charlemagne’s great war was against the Saxons and lasted thirty years (772-804).

The work of organizing the three great Carolingian conquests—Aquitaine, Italy and Saxony—had yet to be done. Charlemagne approached it with a moderation equal to the vigour which he had shown in the war. But by multiplying his advance-posts, the Frankish kingdom came into contact with new peoples, and each new neighbour caused new enmity. Aquitaine bordered upon Musulman Spain; the Avars of Hungary threatened Bavaria with their tireless horsemen; beyond the Elbe and the Saal the Slavs were perpetually at war with the Saxons, and to the north of the Eider were the Danes. All were pagans; all enemies of Charlemagne, defender of Christ’s Church, and hence the appointed conqueror of the world.

Various causes—the weakening of the Arabs by the struggle between the Omeyyads and the Abbasids just after the battle of Tours; the alliance of the petty Christian kings of the Spanish peninsula; an appeal from the northern amirs who had revolted against the new caliphate of Cordova (755)—made Charlemagne resolve to cross the Pyrenees. He penetrated as far as the Ebro, but was defeated before Saragossa; and in their retreat the Franks were attacked by Vascons, losing many men as they came through the passes. This defeat of the rear-guard, famous for the death of the great Roland and the treachery of Ganelo, induced the Arabs to take the offensive once more and to conquer Septimania. Charlemagne had created the kingdom of Aquitaine without deep thought, and now, with the rise of the new nation, the duchy of Toulouse from 790 to 806, succeeded in restoring Frankish authority down to the Ebro, thus founding the Spanish March with Barcelona as its capital. For two centuries and a half the Avars, a remnant of the Huns entrenched in the Hungarian Mesopotamia, had made descents alternately upon the Germans and upon the Greeks of the Eastern empire. They had overrun Bavaria in the very year of its subjugation by Charlemagne (788), and it took an eight-years’ struggle to destroy the robber stronghold. The empire thus pushed its frontier-line on from the Elbe to the Oder, ever as it grew menacing by increasing dangers. The sea came to the help of the depopulated land, and Danish pirates, Widukind’s old allies, came in their leathern boats to harry the coasts of t’e North Sea and the Channel. Permanent armies and walls across isthmuses were alike useless; Charlemagne had to build fleets to repulse his elusive foes (808-810), and even after forty years of war the danger was only postponed.

Meanwhile Pippin’s Frankish kingdom, vast and powerful as it had been, was doubled. All nations from the Oder to the Elbe and from the Danube to the Atlantic were subject or tributary, and Charlemagne’s power even crossed the frontier. Of his many distinguished Christian princes and Musulman amirs flocked to his palaces. The kings of Northumbria and Sussex, the kings of the Basques and of Galicia, Arab amirs of Spain and Fez, and even the caliphs of Bagdad came to visit him in person or sent gifts by the hands of ambassadors. A great warrior and an upright ruler, his
conquests recalled those of the great Christian emperors, and the Church completed the parallel by training him in her lore. This still barely civilized German literally went to school to the English Alcuin and to Peter of Pisa, who, between two campaigns, taught him history, writing, grammar and astronomy, satisfying also his interest in sacred music, literature (religious literature especially), and the traditions of Rome and Constantinople. Why should he not be the heir of their Caesars? And so, little by little, this man of insatiable energy was possessed by the ambition of restoring the Empire of the West in his own favour.

There were, however, two serious obstacles in the way: first, the supremacy of the emperor of the East, which though nominal rather than real was upheld by peoples, princes, and even by popes; secondly, the rivalry of the bishops of Rome, who since the early years of Adrian’s pontificate had claimed the famous “Donation of Constantine” (q.v.). According to that apocryphal document, the emperor after his baptism had ceded to the sovereign pontiff his imperial power and honours, the purple chlamys, the golden crown, “the town of Rome, the districts and cities of Italy and of all the West.” But in 797 the empress of Constantinople had just deposed her son Constantine VI. after putting out his eyes, and therefore might be considered vacant on the death of the other Carolingian, Louis the St. Petersburg III., who had been driven from Rome by a revolt in 799, and had only been restored by a Frankish army, counted for little beside the Frankish monarch, and could not but submit to the wishes of the Carolingian court. So when next year the king of the Franks went to Rome in person, on Christmas Eve of the year 8oo and in the basilica of St Peter the pope placed on his head the imperial crown and did him reverence “after the established custom of the time of the ancient emperors.” The Roman ideal, handed down in tradition through the centuries, was here first revived.

This event, of capital importance for the middle ages, was fertile in results both beneficial and the reverse. It brought about the rupture between the West and Constantinople. Then Charlemagne raised the papacy on the ruins of Lombardy to the position of first political power in Italy; and the universal Church, headed by the pope, made common cause with the Empire, which all the thinkers of that day regarded as the ideal state. Confusion between these powers was inevitable, but at this time neither Charles, the pope, nor the people had a suspicion of the troubles latent in the ceremony that seemed so simple. Thirdly, he strengthened the emperors of the Franks. At the death of his father, Louis the St. Petersburg III., he claimed the title of king of the Franks, as is proved by the fact that at the great assembly of Aix-la-Chapelle in 802 he demanded from all, whether lay or spiritual, a new oath of allegiance to himself as Caesar. His increased power came rather from moral value, from the prestige attaching to one who had given proof of it, than from actual authority over men or centralization; this is shown by the division between the Empire and feudalism. universal sovereignty claimed as a heritage from Rome had a profound influence upon popular imagination, but in no way modified that tendency to separation of the various nations which was already manifest. Charles himself in his government preferred to restore the ancient Empire by vigorous personal action, rather than to follow old imperial traditions; he introduced cohesion into his “palace,” and perfect centralization into his official administration, inspiring his followers and servants, clerical and lay, with a common and determined zeal. The system was kept in full vigour by the missi dominici, who regularly reported or reformed any abuses of administration, and by the courts, military, judicial or political, which brought to Charlemagne the strength of the wealth of his subjects and his ideas to the farthest limits of the Empire. Under him there was in fact a kind of early renaissance after centuries of barbarism and ignorance.

This emperor, who assumed so high a tone with his subjects, his bishops and his counts, who undertook to uphold public order in civil life, held himself no less responsible for the eternal salvation of men’s souls in the other world. Thanks to Charlemagne, and through the restoration of order and of the schools, a common civilization was prepared for the varied elements of the Empire. By his means the Church was able to concentrate in the palatine academy all the intellectual culture of the middle ages, having preserved some of the ancient traditions of organization and administration and safeguarded the imperial ideal. Charlemagne apparently wished, like Theodoric, to use German blood and Christian unity to bring back life to the great body of the Empire. Not the equal of Caesar or Augustus in genius or in the last dying of his work, he yet recalls them in his capitations, his periodic courts, his official hierarchy, his royal emissaries, his ministers, his sole right of coinage, his great public works, his campaigns against barbarism and heathenry, his zeal for learning and literature, and his divinity as emperor. Once more there existed a great public entity such as had not been seen for many years; but its duration was not to be a long one.

Charlemagne had for the moment succeeded in uniting western Europe under his sway, but he had not been able to arrest its evolution towards feudal dismemberment. He had, doubtless conscientiously, laboured for the reconstitution of the Empire; but it often happens that individual wills produce results other than those at which they aimed, sometimes results even contrary to their wishes and his claim to direct obedience from the rest of the people, accepting the mediation of the counts, lords and bishops, who levied taxes, adjudicated and administered in virtue of the privileges of patronage, not of the right of the state. The very multiplication of offices, so noticeable at this time, furthered this triumph of feudalism by multiplying the links of personal dependence, and neutralizing more and more the direct action of the central authority. The frequent convocations of military assemblies, far from testifying to political liberty, was simply a means of communicating the emperor’s commands to the various feudal groups.

Thus Charlemagne, far from opposing, systematized feudalism, in order that obedience and discipline might pass from one man to another down to the lowest grades of society, and he succeeded for his own lifetime. No authority was more weighty or more respected than that of this feudal lord of Gaul, Italy and Germany: none was more transient, because it was so purely personal.

When the great emperor was buried at Aix-la-Chapelle in 814, his work was entombed with him. The fact was that his emperors were incapable of maintaining it. Twenty-nine years after his death the Carolingian Empire had been divided into three kingdoms; forty years later one alone of these kingdoms had split into seven; while when a century had passed France was a litter of tiny states each practically independent. This disintegration was caused neither by racial hate nor by linguistic patriotism. It was the weakness of princes, the discouragement of freemen and landholders confronted by an inexorable system of financial
FRANCE

and military tyranny, and the incompatibility of a vast empire with a too primitive governmental system, that wrecked the work of Charlemagne.

The Empire fell to Louis the Pious, sole survivor of his three sons. At the Aix assembly in 813 his father had crowned him with his own hand, thus avoiding the papal sanction that had been almost forced upon himself in 800. Louis was a gentle and well-trained prince, but weak and prone to excessive devotion to the Church. He had only reigned a few years when dissensions broke out on all sides, as under the Merovingians. Charlemagne had assigned their portions to his three sons in 781 and again in 806; like Charles Martel and Pippin the Short before him, however, what he had divided was not the imperial authority, nor yet countries, but the whole system of fiefs, offices and adherents which had been his own patrimony. The division that Louis the Pious made at Aix in 817 among his three sons, Lothair, Pippin and Louis, was of like character, since he reserved the supreme authority for himself, only associating Lothair, the eldest, with him in the government of the empire. Following the advice of his ministers Walla and Agobard, supporters of the policy of unity, Louis the Pious put Bernard of Italy, Charlemagne's grandson, who by the refusal of Louis to acknowledge Charlemagne as emperor; crushed a revolt in Brittany; and carried the work of evangelization begun among the Slavs. A fourth son, Charles, was born to him by his second wife, Judith of Bavaria. Jealousy arose between the children of the two marriages. Louis tried in vain to satisfy his sons and their followers by repeated divisions—at Worms (829) and at Aix (831)—in which there was no longer question of either unity or subordination. Yet his eldest sons revolted against him in 831 and 832, and were supported by Walla and Agobard and by their followers, weary of all the contradictory oaths demanded of them. Louis was deposed at the assembly of Compiegne (833), the bishops forcing him to assume the garb of a penitent; but he was re-established on his throne in St Etienne at Metz, the 28th of February 835, from which time until his death in 840 he fell more and more under the influence of his ambitious wife, and thought only of securing an inheritance for Charles, his favourite son.

Hardly was Louis buried in the basilica of Metz before his sons flew to arms. The first dynastic war broke out between Lothair, who refused to acknowledge Charlemagne as emperor, and his brothers Louis and Charles. Lothair wanted, with the Empire, the sole right of patronage over the adherents of his house, but each of these latter chose his own lord according to individual interests, obeying his fears or his preferences. The three brothers finished their discussion by fighting for a whole day (June 25th, 841) on the plain of Fontenay aux Auxeres; but the battle decided nothing, so Charles and Louis, in order to get the better of Lothair, allied themselves and their vassals by an oath taken in the plain of Strassburg (Feb. 14th, 842). This, the first document in the vulgar tongue in the history of France and Germany, was merely a mutual contract of protection for the two armies, which nevertheless did not risk another battle. An amicable division of the imperial succession was arranged, and after an assessment of the empire which took almost a year, an agreement was signed at Verdun in August 843.

This was one of the important events in history. Each brother received an equal share of the dismembered empire.

Louis had the territories on the right bank of the Rhine, which included Spires, Worms and Mainz "because of the abundance of wine." Lothair took Italy, the valleys of the Rhone, the Saône and the Meuse, with the two capitals of the empire, Aix-la-Chapelle and Rome, and the title of emperor. Charles had all the country watered by the Scheldt, the Seine, the Loire and the Garonne, as far as the Atlantic and the Elbe. The partition of Verdun separated once more, and definitively, the lands of the eastern and western Franks. The former became modern Germany, the latter France, and each from this time forward had its own national existence. However, as the boundary between the possessions of Charles the Bald and those of Louis was not strictly defined, and as Lothair's kingdom, having no national basis, soon disintegrated into the kingdoms of Italy, Burgundy and Arles, in Lotharingia, this great undefined territory was to serve as a tilting-ground for France and Germany on the very morrow of the treaty of Verdun and for ten centuries after.

Charles the Bald was the first king of western France. Anxious as he was to preserve Charlemagne's traditions of government, he was not always strong enough to do so, and warfare within his own dominions was often forced on him. The Norse pirates who had troubled Charlemagne showed a preference for western France, justified by the easy access afforded by river estuaries with rich monasteries on their shores. They began in 841 with the sack of Rouen; and from then until 912, when they made a settlement in one part of the country, though few in numbers they never ceased attacking Charles's kingdom, coming in their ships up the Loire as far as Auvergne, up the Garonne to Toulouse, and up the Seine and the Scheldt to Paris, where they made four descents in forty years, burning towns, pillaging treasure, destroying harvests and slaughtering the peasants or carrying them off into slavery. Charles was told thus spent his life sword in hand, fighting unsuccessfully against the Danes and the Saxons, who were kings, Nomenœ and Er Heidi, he had to recognize in his wars against the people of Aquitaine, who, in full revolt, appealed for help to his brother, Louis the German. He was beaten everywhere and always: by the Bretons at Ballon (845) and Juvearde (851); by the people of Aquitaine near Angoulême (845); and by the Northmen, who several times extorted heavy ransoms from him. Before long, too, Louis the German actually allied himself with the people of Brittany and Aquitaine, and invaded France at the summons of Charles the Bald's own vassals. Though the treaty of Coblenz (860) seemed to reconcile the two kings for the moment, no peace was ever possible in Charles the Bald's kingdom. His own son Charles, king of Aquitaine, revolted, and Salomon proclaimed himself king of Brittany in succession to Er Heidi, who had been assassinated. To check the Bretons and the Normans, who were attacking from the Atlantic and the Mediterranean, Charles the Bald found himself obliged to enrol the defence of the country to Robert the Strong, a great vassal of Capet and duke of the lands between Loire and Seine. Robert, the Strong, however, though many times victorious over the incorrigible pirates, was killed by them in a fight at Brissarre (866).

Despite all this, Charles spoke authoritatively in his capitularies, and though incapable of defending western France, coveted other crowns and looked obstinately eastwards. He managed to become king of Lorraine on the death of his nephew Lothair II, and emperor and king of Germany on that of his other nephew Louis II. (875); though only by breaking the compact of the year 800. In 876, the year before his death, he took a third crown, that of Italy, though not without a fresh defeat at Andernach by Louis the German's troops. His titles increased, indeed, but not his power; for while his kingdom was thus growing in area it was falling to pieces. The duchy with which he rewarded Robert the Strong was only a military command, but became a powerful fief. Baldwin I. (d. 879), count of Flanders, turned the country between the Scheldt, the Somme and the sea into another feudal principality. Aquitaine and Brittany were almost independent, Burgundy was in full revolt, and within thirty years Rollo, a Norwegian leader, bore the master of the whole of the lower Seine from the Cotentin to the Somme. The fact was that between the king's inability to defend the kingdom, and the powerlessness of nobles and peasants to protect themselves from pillage, every man made it his business to seek new protectors, and the country, in spite of Charles the Bald's efforts, began to be covered with strongholds, the peasant learning to live beneath the shelter of the donjon keeps. Such vassals gave themselves utterly to the lord who guarded them, working for him sword
or pickaxe in hand. The king was far away, the lord close at hand. Hence the sixty years of terror and confusion which came between Charlemagne and the death of Charles the Bald suppressed the direct authority of the king in favour of the nobles, and prepared the way for a second destruction of the monarchy at the hands of a stronger power (see Feudalism).

Before long Charles the Bald's followers were dictating to him; and in the disaffection caused by his feebleness and cowardice prelates and nobles allied themselves against him. If they acknowledged the king's authority at the assemblies of Yutz (near Thionville) in 844, they forced from him a promise that they should keep their fiefs and their dignities; and while establishing a right of control over all his actions they deprived him of his right of jurisdiction over them. Despite Charles's resistance his royal power dwindled steadily: an appeal to Hincmar, archbishop of Reims, entailed concessions to the Church. In 856 some of his vassals deserted him and went over to Louis the German. To win them back Charles had to sign a new charter, by the terms of which loyalty was no longer a one-sided engagement but a reciprocal contract between king and vassal. He gave up his personal right of distributing the fiefs and honours which were the price of adherence, and thus lost for the Carolingians the free disposal of the immense territories they had gradually usurped: they retained the over-lordship; it is true, but this over-lordship, without usufruct and without choice of tenant, was but a barren possession.

Like their territories public authority little by little slipped from the grasp of the Carolingians, largely because of their abuse of their too great power. They had concentrated the entire administration in their own hands. Like Charlemagne, Louis the Pious and Charles the Bald were omnipotent. There were no provincial assemblies, no municipal bodies, no merchant-gilds, no autonomous churches; the people had no means of making themselves heard; they had no place in an administration which was completely in the hands of a central hierarchy of officials of all ranks, from dukes to scabini; with counts, viscounts and centenarii in between. However, these dukes and counts were not merely officials; they too had become lords of fideles, of their own advocati, centenarii and scabini, whom they nominated, and of all the free men of the county, who since Charlemagne's time had been first allowed and then commanded to "commend" themselves to a lord, receiving feudal benefits in return. Any deprivation or super-session of the count might impoverish, despoil or ruin the vassals of the entire county; so that all, vassals or officials, small and great, feeling their danger, united their efforts, and lent each other mutual assistance against the permanent menace of an overweening monarchy. Hence, at the end of the 9th century, the heredity of offices as well as of fiefs.

Decay of the Carolingian power.

The death-struggle of the Carolingians lasted for a century of uncertainty and anxiety, during which time the bishops, counts and lords might well have suppressed the monarchy had they been hostile to it. Such, however, was not their policy; on the contrary, they needed a king to act as agent for their private interests, since they alone could invest their rank and dignities with an official and legitimate character. They did not at once agree on Charles's successor; for some of them chose Eudes (Odo), son of Robert the Strong, for his brilliant defence of Paris against the Normans in 885; others Guy, duke of Spoleto in Italy, who had himself crowned at Langres; while many wished for Arnulf, illegitimate son of Carlemann, king of Germany and emperor. Eudes was victor in the struggle, and was crowned and anointed at Compiègne on the 29th of February 888; but five years later, meeting with defeat after defeat at the hands of the Normans, his followers deserted from him to Charles the Simple, grandson of Charles the Bald, who was also supported by Fulk, archbishop of Reims.

Death-struggle of the Carolingians (885-947).

This first Carolingian restoration took place on the 28th of January 893, and thenceforward throughout this warlike period from 888 to 936 the crown passed from one dynasty to the other according to the interests of the nobles. After desperate strife, an agreement between the two rivals, Arnulf's support, and the death of Odo secured it for Charles III., named the Simple. His subjects regarded faithful to him for a good while, as he put an end to the Norman invasions which had desolated the kingdom for two centuries, and cowed those barbarians, much to the benefit of France. By the treaty of St Clair-sur-Epte (921) their leader Rolf (Rollo) obtained one of Charles's daughters in marriage and the district of the Lower Seine which the Normans had long occupied, on condition that he and his men ceased their attacks and accepted Christianity. Having thus tranquilized the west, Charles took advantage of Louis the Child's death, and conquered Lorraine, in spite of opposition from Conrad, king of Germany (921). But his preference for his new conquest, and for a Lorrainer of low birth named Hagan, aroused the jealousy and discontent of his nobles. They first elected Robert, count of Paris (923), and then after his death in a successful battle near Soissons against Charles the
Hugh strengthened his position in Burgundy, Lorraine and Normandy by means of marriages; but just as his power was at its height he died (956). His death and the minority of his sons, Hugh Capet and Eudes, gave the Carolingian dynasty thirty years more of life.

For nine years (956-965) Bruno, archbishop of Cologne, was regent of France, and thanks to him there was a kind of entente cordiale between the Carolingians and the Robertinians and Otto. Bruno made Lothair recognize Hugh as duke of France and Eudes as duke of Burgundy; but the sons preserved the father's eminence towards king Louis, despite the archbishop's repeated efforts. His death deprived Lothair of a wise and devoted guardian, even if it did set him free from German influence; and the death of Odalric, archbishop of Reims, in 969, was another fatal loss for the Carolingians, succeeded as he was by Adalbero, who, though learned, pious and highly intelligent, was none the less ambitious. On the death of Otto I. (973) Lothair wished to regain Lorraine; but his success was small, owing to his limited resources and the uncertain support of his vassals. In 980, regretting his fruitless quarrel with Otto II., who had ravaged the whole country as far as Paris, and fearing that even with the support of the house of Vermandois he would be crushed like his father Louis IV. between the duke of France and the emperor, who could count on the archbishop of Reims, Lothair made peace with Otto—a great mistake, which cost him the prestige he had gained among his nobles by his fairly successful struggle with the imperial court, doing down his brother-in-law, the swift wrath of Hugh, who thought himself tricked. Otto, meanwhile, whom he was unwise enough to trust, made peace secretly with Hugh, as it was his interest to play off his two old enemies one against the other. However, Otto died first (983), leaving a three-year-old son, Otto III., and Lothair, hoping for Lorraine, upheld the claims of Henry of Bavaria, who wished to oust Otto. This was a war-signal for Archbishop Adalbero and his adviser Gerbert, devoted to the idea of the Roman empire, and determined that it should still be vested in the race of Otto, which had always been beneficent to the Church.

They decided to set the Robertinians against the Carolingians, and on their advice Hugh Capet dispersed the assembly of Compiègne which Lothair had commissioned to examine Adalbero's behaviour. On Lothair's death in 986, Hugh surrounded his son and successor, Louis V., with intrigues. Louis was a weak-minded and violent young man with neither authority nor prestige, and Hugh tried to have him placed under tutelage. After Louis V.'s sudden death, aged twenty, in 987, Adalbero and Gerbert, with the support of the prelates and vassals, resolved to repel the idea of the nobleman from the succession the rightful heir, Charles of Lorraine, who, without influence or wealth, had become a stranger in his own country, and elected Hugh Capet, who, though rich and powerful, was superior neither in intellect nor character. Thus the triple alliance of Adalbero's bold and adroit imperialism with the cautious and vacillating ambition of the duke of the Franks, and the impolitic hostility towards Germany of the ruined Carolingians, resulted in the unlooked-for advent of the new Capetian dynasty.

This event completed the evolution of the forces that had produced feudalism, the basis of the medieval social system. The idea of public authority had been replaced by one that was simpler and therefore better fitted for a half-civilized society—that of dependence of the weak on the strong, voluntarily entered on by means of mutual contract. Feudalism had gained ground in the 8th century; feudalism it was which had raised the first Carolingian to the throne as being the richest and most powerful person in Austrasia; and Charlemagne with all his power had been as utterly unable as the idea of the state to repel the idea of the feudal, crude personal state. Charlemagne's vassals, however, had needed him; while from Charles the Bald onward it was the king who needed the vassals—a change more marked with each successive prince. The feudal system had in fact turned against the king, the vassals using it to secure a permanent hold upon offices and

FRANCE

Simple, Rudolph of Burgundy, his son-in-law. But Herbert of Vermandois, one of the successful combatants at Soissons, coveted the countship of Lison, which Rudolph refused him; and he thereupon proclaimed Charles the Simple, who had confided his cause to him, as king once more. Seeing his danger Rudolph ceded the countship to Herbert, and Charles was relegated to his prison until his death in 942. After unsuccessful wars against the nobles of the South, against the Normans, who asserted that they were bound to no one except Charles the Simple, and against the Hungarians (who, now the Normans were pacified, were acting their part in the East), Rudolph had a return of good fortune in the years between 930 and 936, despite the intrigues of Herbert of Vermandois. Upon his death the nobles assembled to elect a king; and Hugh the Great, Rudolph's brother-in-law, moved by irresolution as much as by prudence, instead of taking the crown, preferred to restore the Carolingians once more in the person of Charles the Simple's son, Louis d'Outremer, himself claiming numerous privileges and enjoying the exercise of power unencumbered by a title which carried with it the jealousy of the nobles.

This restoration was no more peaceful than its predecessor. The Carolingians had as it were a fresh access of energy, and the struggle against the Robertinians went on relentlessly.

Both sides employed similar methods: one was supported by Normandy, the other by Germany; the archbishop of Reims was for the Carolingians, the Robertinians had to content with the less influential bishop of Sens. Louis soon proved to Hugh the Great, who was trying to play the part of a mayor of the palace, that he was by no means a roi faînéant; and the powerful duke of the Franks, growing uneasy, allied himself with Herbert of Vermandois, William of Normandy and his brother-in-law Otto I. king of Germany, who, asserted the loss of Lorraine. Louis defended himself with energy, aided chiefly by the nobles of the South, by his relative Edmund, king of the English, and then by Otto himself, whose brother-in-law he also had become. A peace advantageous to him was made in 942, and on the deaths of his two opponents, Herbert of Vermandois and William of Normandy, all seemed to be going well for him; but his guardianship of Richard, son of the duke of Normandy, aroused fresh strife, and on the 31st of July 945 he fell into an ambush and suffered a captivity similar to his father's of twenty-two years before.

No one had befriended Charles the Simple, but Louis had his wife Gerberga, who won over to his cause the kings of England and Germany, and even Hugh. But he met free, insisting, as payment for his losses, the cession of Lorraine, the countship of Laon, the counties of the kingdom and the last fortified town remaining to the Carolingians (946). Louis was hardly free before he took vengeance, hurried the lands of his rival, restored to the archiepiscopal throne of Reims Artald, his faithful adviser, in place of the son of Herbert of Vermandois, and managed to get Hugh excommunicated by the council of Ingelheim (948) and by the pope. A two years' struggle wearied the rivals, and they made peace in 950. Louis once more held Laon, and in the following year further strengthened his position by a successful expedition into Burgundy. Still his last years were not peaceful; for besides civil wars there were two Hungarian invasions of France (951 and 954).

Louis's sudden death in 954 once more placed the Carolingian line in peril, since he had not had time to have his son Lothair crowned. For a third time Hugh had the disposal of the crown, and he was no more tempted to take it himself in 954 than in 933 or 936: it was too profitless a possession. Thanks to Hugh's support and to the good offices of Otto and his brother Bruno, archbishop of Cologne and duke of Lorraine, Lothair was chosen king and crowned at Reims. Hugh exacted, as payment for his disinterestedness and fidelity, a renewal of his sovereignty over Burgundy with that of Aquitaine as well; he was in fact the viceroy of the kingdom, and others imitated him by demanding indemnities, privileges and confirmation of rights, as was customary at the beginning of a reign.

HISTORY]
fiefs, and to get possession of estates and of power. After Charles the Bad's death no rush had only, so to speak, a shell—administrative officium. No longer firmly rooted in the soil, the monarchy was helpless before local powers which confronted it, seized upon the land, and cut off connexion between throne and people. The king, the supreme lord, was the only lord without lands, a nomad in his own realms, merely lingering there until starved out. Feudalism claimed its new rights in the capitation of Querzy-sur-Oise in 857; the rights of the monarchy began to dwindle in 877.

While vassalage could only be a cause of disintegration, not of unity, and that this disintegration did not at once spread indefatigably was due to the dozen or so great military commands—Flanders, Burgundy, Aquitaine, &c.—which Charles the Bad had been obliged to establish on a strong territorial basis. One of these great vassals, the duke of France, was amply provided with estates and offices, in contrast to the landless Carolingian, and his power, like that of the future kings of Prussia and Austria, was based on military authority, for he had a frontier—

That of Anjou. Then the inevitable crisis had come. For a hundred years the great feudal lords had disposed of the crown as they pleased, handling it back and forward from one dynasty to another. At the same time the power in the vast provinces of the Carolingian empire and its feeble attempt at a still uncivilized community became more and more accentuated. The empire crumbled away by degrees. Each country began to lead its own separate existence, stammering its own tongue; the different nations no longer understood one another, and no longer had any general ideas in common. The kingdoms of France and Germany, still too large, owed their existence to a series of dispositions imposed on sovereigns too feeble to hold their own, and consisted of a great number of small states united by a very slight bond. At the end of the 10th century the duchy of France was the only central part of the kingdom which was still free and without organization. The end was bound to come, and the final struggle was between Loon, the royal capital, and Reims, the ecclesiastical capital, the former carrying with it the soil of France, and the latter the crown. The Capets captured the first in 983 and the other in 987. Henceforth all was over for the Carolingians, who were left with no heritage to save their great name.

Was the day won for the House of Capet? In the 11th century the kings of that line possessed meagre domains scattered about France among the lesser territories, possessions of Brie, Beauce, Beaulvais and Valois. They were hammed in by the powerful duchy of Normandy, the counties of Blois, Flanders and Champagne, and the duchy of Burgundy. Beyond these again stretched provinces practically impenetrable to royal influence: Brittany, Gascony, Toulouse, Septimania and the Spanish March. The monarchy lay stillling in the midst of a luxuriant feudal forest which surrounded its only two towns of any importance: Paris, the city of the future, and Orleans, the city of learning. Its power, exercised with an energy tempered by prudence, ran to waste like its wealth in a suzerainty over turbulent vassals devoid of common government or administration, and was undermined by the same lack of social discipline among its vassals which had sapped the power of the Carolingians. The new dynasty was thus the poorest and weakest of the great civil and ecclesiastical lordships which occupied the country from the estuary of the Scheldt to that of the Llobregat, and bounded approximately by the Meuse, the Saône and the ridge of the Cévennes; yet it cherished a great ambition which it revealed at times during its first century (987-1108)—a determination not to repeat the Carolingian failure. It had to wait two centuries after the revolution of 987 before it was strong enough to take up the dormant tradition of an authority like that of Rome; and until then it cunningly avoided unequal strife in which, victory being impossible, reverses might have weakened those titles, higher than any due to feudal rights, conferred by the heritage of the Caesars and the coronation at Reims, and held in reserve for the future.
of Philip's reign; he was greedy and venal, by no means disdaining the petty profits of brigandage, and he never left his own domains. After a century's lethargy the house of Capet awoke once more with Louis VI. and began the destruction of the feudal polity.

For thirty-four years of increasing warfare this active and energetic king, this brave and persevering soldier, never spared himself, energetically policing the royal demesne against such pillagers as Hugh of Le Puiset or Thomas of Marle. There was, however, but little difference yet between a count of Flanders or of Chartres and Louis VI., the possessor of a but small and perpetually disturbed realm, who was praised by his minister, the monk Suger, for making his power felt as far as distant Berri! This was clearly shown when he attempted to force the great feudal lords to recognize his authority. His bold endeavour to establish William Clito in Flanders ended in failure; and his want of strength was particularly humiliating in his unfortunate struggle with Henry I., king of the English and duke of Normandy, who was powerful and well served, the real master of a comparatively weak barony. Louis only escaped being crushed because he remembered, as did his successors for long after him, that his house owed its power to the Church. The Church has never loved weakness; she has always had a secret sympathy for power, whatever its source, when she could hope to capture it and make it serve her ends. Louis VI. defended her against feudal robbers; and she supported him in his struggles against the nobles, making him, moreover, by his son's marriage with the heiress of Aquitaine, the greatest and richest landholder of the kingdom. But Louis was not the obedient tool she wished for. With equal firmness and success he vindicated his rights, whether against the indirect attacks of the papacy 'on his independence, or the claims of the ecclesiastical courts which, in principle, he made subordinate to the jurisdiction of the crown; whether in episcopal elections, or in ecclesiastical reforms which might possibly imperil his power or his revenues. The prestige of this energetic king, protector of the Church, of the infant communities in the towns, and of the peasants as against the constant oppressions of feudalism, became still greater at the end of his reign, when an invasion of the German emperor Henry V. in alliance with Henry Beaufort of Normandy (Henry I. of England), rallied his subjects round the oriflamme of St Denis, awakening throughout northern France the unanimous and novel sentiment of national danger. Unquestionably this successor, Louis VII., almost destroyed his work by a colossal blunder, although circumstances seemed much in his favour. Germany and England, the two powers especially to be dreaded, were busy with internal troubles and quarrels of succession. On the other hand, thanks to his marriage with Eleanor of Aquitaine, Louis's own domains had been increased by the greater part of the country between the Loire and the Pyrenees; while his father's minister, the monk Suger, continued to assist him with his moderation and prudence. His first successes against Theobald of Champagne, who for thirty years had been the most dangerous of the great French barons and had refused a vassal's services to Louis VI., as well as the adroit diplomacy with which he wrested from Geoffrey the Fair, count of Anjou, a part of the Norman Vexin long claimed by the French kings, in exchange for permitting him to conquer Normandy, augured well for his boldness and activity, had he but confined them to serving his own interests. The second crusade, undertaken to exalt his burning of the church of Vitry, inaugurated a series of magnificent but fruitless exploits; while his wife was the cause of domestic quarrels still more disastrous. Poverty and a thirst for glory impelled Louis to take the lead in this fresh expedition to the Holy Land, despite the opposition of Suger, and the hesitation of the pope, Bernard of Clairvaux and the barons. The alliance with the German king Conrad III. only enhanced the difficulties of an enterprise already made hazardous by the misunderstandings between Greeks and Latins. The Crusade ended in the double disaster of military defeat and martial dishonour (1147-1149); and Suger's death in 1151 deprived Louis of a counsellor who had exercised the regency skillfully and with success, just at the very moment when his divorce from Eleanor was to jeopardize the fortunes of the Capets.

For the proud and passionate Eleanor married, two months later (May 1152), the young Henry, count of Anjou and duke of Normandy, who held, besides these great fiefs, the whole of the south-west of France, and in two years' time the crown of England as well. Henry and Louis at once engaged in the first Capet-Angevin duel, destined to last a hundred years (1152-1252). When France and England thus entered European history, their conditions were far from being equal. In England royal power was strong; the size of the Angevin empire was vast, and the succession assured. It was only abuse of their too-great powers that ruined the early Angevin kings. France in the 12th century was merely a federation of separate states, jealously independent, which the king had to negotiate with rather than rule; while his own possessions, shorn of the rich heritage of Aquitaine, were, so to speak, swamped by those of the English king. For some time it was feared that the French kingdom would be entirely absorbed. In consequence of the marriage between Louis's daughter and Henry II.'s eldest son, the king of England, the whole south of France, Henry II. being markedly superior to Louis in political resource, military talent and energy. He failed, however, to realize his ambition of shutting in the Capet king and isolating him from the rest of Europe by crafty alliances, notably that with the emperor Frederick Barbarossa — while watching an opportunity to supplant him upon the French throne. It is extraordinary that Louis should have escaped final destruction, considering that Henry had subdued Scotland, taken Anjou from his brother Geoffrey, won a hold over Brittany, and schemed successfully for Languedoc. But the Church once more came to the rescue of her devoted son. The retreat to France of Pope Alexander III., after he had been driven from Rome by the emperor Frederick in favour of the anti-pope Victor, revived Louis's moral prestige. Henry II.'s quarrel with Thomas Becket, archbishop of Canterbury, which ran its course in France (1164-1171) as a struggle for the independence and reform of the Church, both threatened by the Constitutions of Clarendon, and ended with the murder of Becket in 1172, gave Louis yet another advantage over his rival. Finally the birth of Philip Augustus (1165) after thirty years of childless wedlock, saved the kingdom from a year of succession just at the time when the powerful Angevin sway, based entirely upon force, was jeopardized by the rebellion of Henry II.'s sons against their father. Louis naturally rejoined the coalition of 1173, but showed no more vigour in this than in his other wars; and his fate would have been sealed had not the pope checked Henry by the threat of an interdict, and reconciled the combatants (1177). Louis had still time left to effect the coronation of his son Philip Augustus (1179), and to associate him with himself in the exercise of the royal power for which he had grown too old and infirm.

Philip Augustus, who was to be the bitterest enemy of Henry II. and the Angevins, was barely twenty before he revealed the full measure of his cold energy and unscrupulous ambition. In five years (1180-1186) he rid himself of the overshadowing power of Philip of Alsace, count of Flanders, and his own uncles, the counts of Champagne; while the treaty of May 20th, 1186, was his first rough lesson to the feudal leagues, which he had reduced to powerlessness, and to the subjugated duke of Burgundy and count of Flanders. Northern and eastern France recognized the suzerainty of the Capet, and Philip Augustus was now bold enough to attack Henry II., the master of the west, whose friendly neutrality (assured by the treaty of Gisors) had made possible the successive defeats of the great French barons. Like his father, Philip understood how to make capital out of the quarrels of the aged and ailing Henry II. with his sons, especially with Richard, who claimed his French heritage in his father's lifetime, and raised up enemies for the disunited Angevins even...
in Germany. After two years of constant defeat, Henry's capitulation at Aazl proved once more that fortune is never with the old. The English king had to submit himself to "the advice and desire of the king of France," doing him homage for all continental fiefs (1187-1189).

The defection of his favourite son John gave Henry his death-blow, and Philip Augustus found himself confronted by a new king of England, Richard Cœur de Lion, as powerful, besides being younger and more energetic. Philip's ambition could not rest satisfied with the petty principalities of Amiens, Vermarnois and Valois, which he had added to the royal demesne. The third crusade, undertaken, sorely against Philip's will, in alliance with Richard, only increased the latent hostility between the two kings; and in 1192 Philip abandoned the enterprise in order to return to France and try to plunder his absent rival. Despite his solemn oath to no scruples troubled him: witness the large sums of money he offered to the emperor Henry VI. if he would detain Richard, who had been made prisoner by the duke of Austria on his return from the crusade; and his negotiations with the papal legate, Baldwin Lackland, who acknowledged England in exchange for the cession of Normandy. But Henry VI. suddenly liberated Richard, and in five years that "devil set free" took from Philip all the profit of his trickery, and shut him off from Normandy by the strong fortress of Château-Gaillard (1104-1190).

Happily an accident which caused Richard's death at the siege of Chalus, and the evil imbecility of his brother and successor, John Lackland, brilliantly restored the fortunes of the Capets. The quarrel between John and his nephew Arthur of Brittany gave Philip Augustus one of those opportunities of profiting by family discord which, coinciding with discontent among the various peoples subject to the house of Anjou, had stood him in such good stead against Henry II. and Richard. He demanded renunciation on John's part, not of Anjou only, but of Poitou and Normandy — of all his French-speaking possessions, in fact — in favour of Arthur, who was supported by William des Roches, the most powerful lord of the region of the Loire. Philip's divorce from Ingeborg of Denmark, who appealed successfully to Pope Innocent III., merely delayed the inevitable conflict. John of England, moreover, was a past-master in the art of making enemies of his friends, and his conduct towards his vassals of Aquitaine furnished a judicial pretext for conquest. The royal judges at Paris condemned John, as a felon, to death and the forfeiture of his fiefs (1203), and the murder of Arthur completed his ruin. Philip Augustus made a vigorous onslaught on Normandy in right of justice and of superior force, took the formidable fortress of Château-Gaillard on the Seine after several months' siege, and invested Rouen, which John abandoned, fleeing to England. In Anjou, Touraine, Maine and Poitou, lords, towns and abbeys made their submission, won over by Philip's bribes despite Pope Innocent III.'s attempts at intervention. In 1208 John was obliged to own the Plantagenet continental power as lost. There were no longer two rival monarchies in France; the feudal equilibrium was destroyed, to the advantage of the duchy of France.

But Philip in his turn nearly allowed himself to be led into an attempt at annexing England, and so reversing for his own benefit the work of the Angevins (1213); but, happily for the future of the dynasty, Pope Innocent III. prevented this. Thanks to the ecclesiastical sanction of his royalty, Philip had successfully braved the pope for twenty years, in the matter of Ingeborg and again in that of the German schism, when he had supported Philip of Swabia against Otto of Brunswick, the pope's candidate. In 1213, John Lackland, having been in conflict with Innocent regarding the archiepiscopal see of Canterbury, had made submission and done homage for his kingdom, and Philip wished to take vengeance for this at the expense of the rebellious vassals of the north-west, and of Renaud and Ferrand, counts of Boulogne and Flanders, thus combating English influence in those quarters.

This was a return to the old Capet policy; but it was also menacing to many interests, and sure to arouse energetic resistance. John seized the opportunity to consolidate against Philip a European coalition, which included most of the feudal lords in Flanders, Belgium and Lorraine, and the emperor Otto IV. So dangerous did the French monarchy already seem! John began operations with an attack from Anjou, supported by the notably capricious nobles of Aquitaine, and was routed by Philip's son at La Roche aux Moines, near Angers, on the 2nd of July 1214. Twenty-five days later the northern allies, intending to surprise the smaller French army on its passage over the bridge at Bouvines, themselves sustained a complete defeat. This first national victory had not only a profound effect on the whole kingdom, but produced consequences of far-reaching importance: in Germany it brought about Otto's fall before Frederick II.; in England it introduced the great drama of 1215, the first act of which closed with Magna Carta — John Lackland being forced to acknowledge the control of his barons, and to share with them the power he had abused and disgraced. In France, on the contrary, the throne was exalted beyond rivalry, raised far above a feudalism which never again would act on acts of independence or rebellion. Bouvines gave France the supremacy of the West. The feudalism of Languedoc was all that now remained to conquer.

The whole world, in fact, was unconsciously working for Philip Augustus. Anxious not to risk his gains, but to consolidate them by organization, Philip henceforth until his death in 1223 operated through diplomacy alone, leaving to others the toil and trouble of conquests, the advantages of which were not for them. When his son Louis wished to wrest the English crown from John, now crushed by his barons, Philip intervened without seeming to do so, first with the barons, then with Innocent III., supporting and disowning his son by turns; until the latter, held in check by Rome, was forced to sign the treaty of Lambeth (1217). When the Church and the needy and fanatical nobles of northern and central France destroyed the feudal dynasty of Toulouse and the rich civilization of the south in the Albigenian crusade, it was for Philip Augustus that their leader, Simon de Montfort, all unknowing, conquered Languedoc. At last, instead of the two Frankes of the langue d'oïl and the langue d'oil, there was but one royal France comprising the whole kingdom.

Philip Augustus was not satisfied with the destruction of a turbulent feudalism; he wished to substitute for it such unity and peace as had obtained in the Roman Empire; and just as he had established his supremacy over the feudal lords, so now he managed to extend it over the clergy, and to bend them to his will. He took advantage of their weakness in the midst of an age of violence. By contracts of "pariage" the clergy claimed and obtained the king's protection even in places beyond the king's jurisdiction, to their common advantage. Philip thus set the feudal lords one against the other; and against them all, first the Church, then the communes. He exploited also the townspeople's need for security and the instinct of independence which made them claim a definite place in the feudal hierarchy. He was the actual creator of the communes, although an interested creator, since they made a breach in the fortress of feudalism and extended the royal authority far beyond the king's demesne. He did even more: he gave monarchy the instruments of which it still stood in need, gathering round him in Paris a council of men humble in origin, but wise and loyal; while in 1190 he instituted baillis and seneschals throughout his enlarged dominions, all-powerful over the nobles and subservient to himself. He filled his treasury with spoils harshly wrung from all classes; thus inaugurating the monarchy's long and patient labours at enlarging the crown lands bit by bit through taxes on private property. Finally he created an army, no longer the temporary feudal est, but a more or less permanent royal force. By virtue of all these organs of government the throne guaranteed peace, justice and a secure future, having routed
feudalism with sword and diplomacy. Philip's son was the first of the Capets who was not crowned during his father's lifetime; a fact clearly showing that the principle of heredity had now been established beyond discussion.

Louis VIII's short reign was but a prolongation of Philip's in its realization of his two great designs: the recovery from Henry III. of England of Poitou as far as the Garonne; and the crusade against the Albigenses, which with small pains procured him the succession of Amaury de Montfort, and the Languedoc of the counts of Toulouse, if not the whole of Gascony. Louis VIII died on his return from this short campaign without having proved his full worth.

But the history of France during the 11th and 12th centuries does not entirely consist of these painful struggles of the Capet dynasty to shake off the fetters of feudalism. France, no longer split up into separate fragments, now began to exercise both intellectual and military influence over Europe. Everywhere her sons gave proof of rejuvenated activity. The Christian missions which others were reviving in Prussia and beginning in Hungary were undertaken on a vastly larger scale by the Capets. These "elder sons of the Church" made themselves responsible for carrying out the "work of God," and French pilgrims in the Holy Land prepared the great movement of the Crusades against the infidels. Religious faith, love of adventure, the hope of making advantageous conquests, anticipations of a promised paradise—combined to form the great advance upon the Orient, which though failing to rescue the sepulchre of Christ, the ephemeral kingdoms of Jerusalem and Cyprus, the dukedom of Athens, or the Latin empire of Constantinople, yet gained for France that prestige for military glory and religious piety which for centuries constituted her strength in the Levant (see CRUSADES). At the call of the pope other members of the French chivalry also made victorious expeditions against the Mussulmans, and founded the Christian kingdom of Portugal. Obedeying that enterprise spirit which was to take them to England half a century later, Normans descended upon southern Italy and wrested rich lands from Greeks and Saracens.

In the domain of intellect the advance of the French showed a no less dazzling and a no less universal activity; they sang as well as they fought, and their epics were worthy of their swordsmanship, while their cathedrals were hymns in stone as ardent as their soaring flights of devotion. In this period of intense religious life France was always in the vanguard. It was the ideas of Cluny monks that freed the Church from feudal supremacy, and in the 11th century produced a Pope Gregory VII; the spirit of free investigation shown by the heretics of Orleans inspired the rude Breton, Abelard, in the 12th century; and with Gerbert and Fulbert of Chartres the schools first kindled that brilliant light which the university of Paris, organized by Philip Augustus, was to shed over the world from the heights of Sainte-Geneviève. In the quarrels of the priesthood under the Emperor Henry IV., the Cluniacs of the famous abbey of Clarendon professed to arrest the papacy on the slippery downward path of theocracy; finally, it was in Suger's church of St. Denis that French art began that struggle between light against darkness which, culminating in Notre-Dame and the Sainte-Chapelle, was to teach the architects of the world the delight of building with airiness of expression. The old basilica which contains the history of the monarchy sums up the whole of Gothic art to this day, and it was Suger who in the domain of art and politics brought forward once more the conception of unity. The courteous ideal of French chivalry, with its "delectable" language, was adopted by all seignorial Europe, which thus became animated, as it were, by the life-blood of France. Similarly, in the universal movement of those forces which made for freedom, France began the age-long struggle to maintain the rights of civil society and continually to enlarge the social categories. The townsman enriched by commerce and the emancipated peasant tried more or less valiantly to shake off the yoke of the feudal system, which had been greatly weakened, if not entirely broken down, by the crusades. Grouped around their bell-towers and organized within their gilds, they were now able to wax merry in their free jocular language over their own hardships, and still more over the vices of their lords. They insinuated themselves into the counsels of their ignorant masters, and though still sitting humbly at the feet of the barons, these upright and well-educated servitors were already dreaming of the great deeds they would do when their tyrants should have vacated their high position, and when royalty should have summoned them to power.

By the beginning of the 13th century the Capet monarchy was so strong that the crisis occasioned by the sudden death of Louis VIII was easily surmounted by the foreign woman and the child whom he left behind. It is true that that woman was Blanche of Castile, and that child the future Louis IX. A virtuous and very devout Spanish princess, Blanche assumed the regency of the kingdom and the tutelage of her child, and carried them on for nine years with so much force of character and capacity for rule that she soon impressed the claimants and disorderly leaders of the opposition (1226-1235). By the treaty of Meaux (1229), her diplomacy combined with the influence of the Church to prepare effectually for the annexation of Languedoc to the kingdom, supplementing this again by a portion of Champagne; and the marriage of her son to Margaret of Provence definitely broke the ties which held the country within the orbit of the German empire. She managed also to keep out of the great quarrel between Frederick II. and the papacy which was convulsing Germany. But her finest achievement was the education of her son; she taught him that lofty religious morality which in his case was not merely a rule for private conduct, but also a political programme to which he remained faithful even to the detriment of his apparent interests. With Louis IX. for the first time peremptorily and dominated politics; he had but one end: to do justice to every one and to reconcile all Christendom in view of a general crusade.

The oak of Vincennes, under which the king would sit to mete out justice, cast its shade over the whole political action of Louis IX. He was the arbiter of townspeople, of feudal lords and of kings. The interdiction of the judicial duel, "quarantaine le roi," i.e., "the king's truce of forty days" during which no vengeance might be taken for private wrongs, and the assurament,1 went far to diminish the abuses of warfare by allowing his mediation to make for a spirit of reconciliation throughout his kingdom. When Thibaud (Theobald), count of Champagne, attempted to marry the daughter of Pierre Maucier, duke of Brittany, without the king's consent, Louis IX., who held the county of Champagne at his mercy,contented himself with exacting guarantees of peace. Beyond the borders of France, at the time of the emperor Frederick II.'s conflict with a papacy threatened in its temporal powers, though he made no response to Frederick's appeal to the civil authorities urging them to present a solid front against the encroachments of the Church, and though he might have arrogated to himself the right to create emperors, he did not admit the imperial crown which Gregory IX. offered him for one of his brothers. He always hoped to bring about an honourable agreement between the two adversaries, and in his estimation

1 The assurament (assecuratio, assecuramentum) differed from the truce, which was a suspension of hostilities by mutual consent, in so far as it was a peace forced by judicial authority on one of the parties at the request of the other. The party desiring protection applied for the assurament, either before or during hostilities, to any royal, imperial or court feudal judge, who then cited the other party to appear and take an oath that he would assure the person, property and dependants of his adversary (qu'il l'assurera, elle et les siens). This custom, which became common in the 13th century, of course depended for its effectiveness on the degree of respect inspired in the feudal nobles by the courts. It was difficult, for instance, to refuse or to violate an assurament imposed by a royal baili or by the parlement itself. See A. Luchaire, Manuel des institutions francaises (Paris, 1892), p. 233.—(W. A. P.)
the advantages of peace outweighed personal interest. In matters concerning the succession in Flanders, Hainault, and Navarre; in the quarrels of the princes regarding the Empire, and in those of Henry III. of England with his barons; it was because of his justice and his disinterestedness that he was appealed to as a trusted mediator. His conduct towards Henry III. was certainly a most characteristic example of his behaviour.

The king of England had entered into the coalition formed by the nobility of Poitou and the count of Toulouse to prevent the execution of the treaty of 1220 and the enfeoffment of Poitou to the king’s brother Alphonse. Louis IX. defeated Henry III. twice within two days, at Taille-bourg and at Saintes, and obliged him to demand a truce (1242). It was forbidden that any lord should be a vassal both of the king of France and of the king of England. After this Louis IX. had set off upon his first crusade in Egypt (1248-54), and on his return he wanted to make this truce into a definite treaty and to “set love” between his children and those of the English king. By a treaty signed at Paris (1259), Henry III. renounced all the conquests of Philip Augustus, and Louis IX. those of his father Louis VIII.—an example unique in history of a victorious king spontaneously giving up his spoil solely for the sake of peace and justice, yet proving by his act that honesty is the best policy; for monarchy gains nothing by the moral authority which belongs to Louis IX. the universal arbiter.

But his love of peace and concord was not always “sans grands despens” to the kingdom. In 1258, by renouncing his rights over Roussillon and the countship of Barcelona, conquered by Charlemagne, he made an advantageous bargain because he kept Montpellier; but he committed a grave fault in consenting to accept the offers regarding Sicily made by Pope Urban IV. to his brother the count of Anjou and Provence. That was the origin of the expeditions into Italy on which the house of Valois was two centuries later to squander the resources of France unavailingly, compromising beyond the Alps its interests in the Low Countries and upon the Rhine. But Louis IX.’s worst error was his obsession with regard to the crusades, to which he sacrificed everything. Despite the signal failure of the first crusade, when he had been taken prisoner; despite the protests of his mother, of his counsellors, and of the pope himself, he flung himself into the mad adventure of Tunis. Nowhere was his blind faith more plainly shown, combined as it was with total ignorance of the formidable migrations that were convulsing Asia, and of the complicated game of politics just then proceeding between the Christian nations and the Moslems of the Mediterranean. At Tunis he found his death, on the 25th of August 1270.

The death of Louis IX. and that of his brother Alphonse of Poitiers, heir of the count of Toulouse, made Philip III.,

Philip III.,

the Bold, legitimate master of northern France and undisputed sovereign of southern France. From the latter he detached the comitat Venaisson in 1274 and gave it to the papacy, which held it until 1701. But he had not his father’s great soul nor disinterested spirit. Urged by Pope Martin IV. he began the fatal era of great international wars by his unlucky crusade against the king of Aragon, who, thanks to the massacre of the Sicilian Vespers, substituted his own predominance in Sicily for that of Charles of Anjou. Philip returned from Spain only to die at Perpignan, ending his insignificant reign as he had begun it, amid the sorrows of a disastrous retreat (1270-1285). His reign was but a halting-place of history between those of Louis IX. and Philip the Fair, just when the transition was taking place from the last days of the middle ages to the modern epoch.

The middle ages had been dominated by four great problems. The first of these had been to determine whether there should be a universal empire exercising tutelage over the nations; and if so, to whom this empire should belong, to pope or emperor. The second had been the extension to the East of that Catholic unity which reigned in the West. Again, for more than a century, the question had also been debated whether the English kings were to preserve and increase their power over the soil of France. And, finally, two principles had been confronting one another in the internal life of all the European states: the feudal and the monarchical principles. France had not escaped any of these conflicts; but Philip the Fair was the initiator or the instrument (it is difficult to say which) who was to put an end to both imperial and theocratic dreams, and to the international crusades; who was to remove the political axis from the centre of Europe, much to the benefit of the western monarchies, now definitely emancipated from the feudal yoke and firmly organized against both the Church and the barons. The hour had come for Dante, the great Florentine poet, to curse the man who was to dismember the empire, precipitate the fall of the papacy and discipline feudalism.

Modern in his practical schemes and in his calculated purpose, Philip the Fair was still more so in his method, that of legal procedure, and, in his agents, the lawyers. With him the French monarchy defined its ambitions, and little by little forsook its feudal and ecclesiastical character in order to clothe itself in juridical forms. His aggressive and litigious policy and his ruthless financial method were due to those lawyers of the south and of Normandy who had been nurtured on Roman law in the universities of Bologna or Montpellier, had practised chancery in the provincial courts, and had been educated by the papacy in the arena of politics, and were now leading the king and filling his parlament. It was no longer upon religion or morality, it was upon imperial and Roman rights that these chevaliers et lois based the prince’s omnipotence; and nothing more clearly marks the new tradition which was being elaborated than the fact that all the great events of Philip the Fair’s reign were lawsuits.

The first of these was with the papacy. The famous quarrel between the priesthood and the Empire, which had culminated at Canossa under Gregory VII., in the apothecary of the Lateran council under Innocent III., and again in the fall of the house of Hohenstaufen under Innocent IV., was reopened with the king of France by Boniface VIII. The quarrel began in 1294 about a question of money. In his bull Clerics latios the pope protested against the taxes levied upon the French clergy by the king, whose expenses were increasing with his conquests. But he had not insisted; because Philip, between feudal vassals ruined by the crusades and lower classes fleeced by everybody, had threatened to forbid the exportation from France of any ecclesiastical gold and silver. In 1301 and 1302 the attempt was to arrest various bishops and abbots, to their surprise of Pamiers, by the officers of the king, and the citation of this cleric before the king’s tribunal for the crime of jueque-majesté, revived the conflict and led Boniface to send an order to free Saiset, and to put forward a claim to reform the kingdom under the threat of excommunication. In view of the gravity of the occasion Philip made an unusually extended appeal to public opinion by convoking the states-general at Notre-Dame in Paris (1302). Whatever were their views as to the relations between ecclesiastical and secular jurisdiction, the French clergy, ruined by the dues levied by the papal court, ranged themselves on the national side with the nobility and the bourgeoisie; whereupon the king, with a bold stroke far ahead of his time, gave tit for tat. His chancellor, Nogaret, went to Anagni to seize the pope and drag him before a council; but Boniface died without confessing himself vanquished. As a matter of fact the king and his lawyers triumphed, where the house of Swabia had failed. After the death of Boniface the splendid fabric of the medieval theocracy gave place to the rights of civil society, the humiliation of Avignon, the disruption of the great schism, the vain efforts of the councils to perform, and the radical and heretical solutions of Wycliffe and Huss.

The affair of the Templars was another legal process carried out by the same Nogaret. Of course this military religious order had lost utility and justification when the Holy Land had been evacuated and the crusades were over. Their great mistake had lain in becoming rich, and rich to excess, through serving as bankers to princes, kings and popes; for great financial powers soon became
unpopular. Philip took advantage of this hatred of the lower classes and the cowardice of his creatures. Pope Clement V., to satisfy his desire for money. The trial of the order (1307-1312) was a remarkable example of the use of the religious tribunal of the Inquisition as a political instrument. There was a dramatic completeness to this unexpected result of the crusades. A general arbitrary arrest of the Templars, the sequestration of their property, examination under torture, the falsifying of procedure, extortion of money from the pope, the auto-da-fé of innocent victims, the dishonest pillaging of their goods by the joint action of the king and the pope: such was the outcome of this vast process of secularization, which foreshadowed the events of the 16th and 18th centuries.

External policy had the same litigious character. Philip the Fair instituted suits against his natural enemies, the king of England and the count of Flanders, foreign princes holding possessions within his kingdom; and against the emperor, whose ancient province of Lorraine and kingdom of Arles constantly changed hands between Germany and France. Philip began by interfering in the affairs of Sicily and Aragon, his father’s inheritance; after which, on the pretext of a quarrel between French and English sailing in the Channel, he established a procedure: a citation of the king of England before the parlement of Paris, and in case of default, a decree of forfeiture; the whole followed by execution—that is to say by the unimportant war of 1305. A truce arranged by Boniface VIII. restored Guinevere to Edward I., gave him the hand of Philip’s sister for himself and that of the king’s daughter for his son (1298).

A still more lengthy and unfortunate suit was the attempt of Philip the Fair and his successors to incorporate the Flemish fief like the English one (1300-1326), thus coming into conflict with proud and turbulent republics composed of wool and cloth merchants, weavers, fullers and powerful counts. Guy de Dampierre, count of Namur, who had become count of Flanders on the death of his mother Margaret II. in 1279—an ambitious, greedy and avaricious man—was arrested at the Louvre on account of his attempt to marry his daughter to Edward I.’s eldest son without the consent of his suzerain Philip. Released after two years, he sided definitely with the king of England when the latter was in arrears with his arrears, a public procedure: a citation of the king of England before the parlement of Paris, and in case of default of a decree of forfeiture; the whole followed by execution—that is to say by the unimportant war of 1305. A truce arranged by Boniface VIII. restored Guinevere to Edward I., gave him the hand of Philip’s sister for himself and that of the king’s daughter for his son (1298).

The efforts of Philip the Fair to expand the limits of his kingdom on the eastern border were more fortunate. His marriage had gained him Champagne; and he afterwards extended his influence over Franche Comté, Bar and the bishoprics of Lorraine, acquiring also Viviers and the important town of Lyons—all this by force of arms than by the expenditure of money. Disdaining the illusory dream of the imperial crown, still cherished by the legates, he pushed forward towards that fluctuating eastern frontier, the line of least resistance, which would have yielded to him had it not been for the unfortunate interruption of the Hundred Years’ War.

His three sons, Louis X., Philip V. the Tall, and Charles IV., continued his work. They increased the power of the monarchy politically by destroying the feudal reaction excited in 1314 by the tyrannical conduct of the jurists, like Enguerrand de Marigny, and by the increasing financial extortions of their father; and they also—notably Philip V., one of the most hard-working of the Capets—increased it on the administrative side by specializing the services of justice and of finance, which were separated from the king’s council. Under these mute self-effacing kings the progress of royal power was only the more striking. With them the senior male line of the house of Capet became extinct.

During three centuries and a half they had effected great things: they had founded a kingdom, a royal family and civil institutions. The land subject to Hugh Capet in 987, barely representing two of the modern départements of France, in 1328 covered a space equal to fifty-nine of them. The political unity of the kingdom was only fettered by the existence of four large isolated fiefs: Flanders on the north, Brittany on the west, Burgundy on the east and Guienne on the south. The capital, which for long had been movable, was now established in the Louvre at Paris, fortified by Philip Augustus. Like the fiefs, feudal institutions at large had been shattered. The Roman tradition which made the will of the sovereign law, gradually propagated by the teaching of Roman law—the law of servitude, not of liberty—and already proclaimed by the jurist Philippe de Beaumanoir as superior to the customs, had been of immense support to the interest of the state and the views of the monarchs; and finally the Capets, so humble of origin, had created organs of general administration to support and centralize the crown. In their grand council and their domains they would have none but silent, servile and well-disciplined agents. The royal exchequer, which was being painfully elaborated in the chambre des comptes, and the treasury of the crown lands at the Louvre, together barely sufficed to meet the expenses of this more complicated and costly machinery. The uniform justice exercised by the parlement spread gradually over the whole kingdom by means of cas royaux (royal cases), and at the same time the royal coinage became obligatory. Against this exaltation of their power two adversaries might have been formidable; but one, the Church, was a captive in Babylon, and the second, the people, was deprived of the communal liberties which it had abused, or humbly effaced itself in the states-general behind the declared will of the king. This well-established authority was also supported by the revered memory of "Monseigneur Saint Louis"; and it is this prestige, the strength of this ideal superior to all other, that explains how the royal prerogative came to survive the mistakes and fortunes of the Hundred Years’ War.

On the extinction of the direct line of the Capets the crown passed to a younger branch, that of the Valois. Its seven representatives (1328-1498) were on the whole very inferior to the Capets, and, with the exception of Charles V. and Louis XI., possessed neither their political sense nor even their good common sense; they cost France the loss of her great advantage over all other countries. During this century and a half France passed through two very severe crises: under the first five Valois the Hundred Years’ War imperilled the kingdom’s independence; and under Louis XI. the struggle against the house of Burgundy endangered the territorial unity of the monarchy that had been established with such pains upon the ruins of feudalism.

Charles the Fair having died and left only a daughter, the nation’s rights, so long in abeyance, were once more regained. An assembly of peers and barons, relying on two precedents under Philip V. and Charles IV., declared that “no woman, nor therefore her son, could in law exercise the succession to the monarchy of France.” This definite decision was of the utmost importance since the Salic law was given much later, set aside Edward III., king of England, grandson of Philip the Fair, nephew of the late kings and son of their sister Isabel. Instead it gave the crown to the feudal chief, the hard and coarse Philip VI. of Valois, nephew of Philip the Fair. This at once provoked war between the two monarchies, English and French, which, including periods of truce, lasted for a hundred and sixteen years. Of active warfare there were two periods, both disastrous to begin with, but ending favourably: one lasted from 1337 to 1378 and the other from 1413 to 1453, thirty-three years of distress and folly coming in between.
However, the Hundred Years' War was not mainly caused by the pretensions of Edward III. to the throne of the Capets; since after having long hesitated to do homage to Philip VI. for his possessions in Guienne, Edward at last brought himself to it—though certainly only after lengthy negotiations, and even threats of war in 1331. It is true that six years later he renounced his homage and again claimed the French inheritance; but this was on the ground of personal grievances, and for economic and political reasons. There was a natural rivalry between Edward III. and Philip VI., both of them young, fond of the life of chivalry, festal magnificence, and the "belles apertises d'armes." This rivalry was aggravated by the enmity between Philip VI. and Robert of Artois, his brother-in-law, who, after having warmly supported the disheriting of Edward III., had been convicted of deceit in a question of succession, had, on him himself on Philip by burning his waxen effigy, and had been welcomed with open arms at Edward's court. Philip VI. had taken reprisals against him in 1336 by making his parlement declare the forfeiture of Edward's lands and castles in Guienne; but the Hundred Years' War, at first simply a feudal quarrel between vassal and suzerain, soon became the great national conflict, in consequence of what was occurring in Flanders.

The communes of Flanders, rich, hard-working, jealous of their liberties, had always been resistent under the authority of their counts and the influence of their suzerain, the king of France. The affair at Cassel, where Philip VI. had avenged the injuries done by the people of Bruges in 1325 to their count, Louis of Nevers, had also compromised English interests. To attack the English through their colonies, Guienne and Flanders, was to injure them in their most vital interests—cloth and claret; for England sold her wool to Bruges in order to pay Bordeaux for her wine. Edward III. had replied by permitting the exportation of English wool, and by threatening the great industrial cities of Flanders with the transference to England of the cloth manufacture—an excellent means of stirring them up against the French, as without wool they could do nothing. Workless, and in desperation, they threw themselves on Edward's mercy, by the advice of a rich citizen of Ghent, Jacob van Artevelde (q.v.); and their last scruples of loyalty gave way when John of Montfort cowed the nobility under Robert of Artois and of Artevelde, and to claim the crown of France.

The war began, like every feudal war of that day, with a solemn defiance, and it was soon characterized by terrible disasters. The destruction of the finest French fleet that had yet been seen, surprised in the port of Sluys, closed the sea to the king of France; the struggle was continued on land, but with little result. Flanders tired of it, but fortunately for Edward III. Brittany now took fire, through a quarrel of succession, analogous to that in France, between Charles of Blois (who had married the daughter of the late duke and was a nephew of Philip VI., by whom he was supported) and John of Montfort, brother of the old duke, who naturally asked assistance from the king of England. But here, too, nothing important was accomplished; the capture of John of Montfort at Nantes deprived Edward of Brittany at the very moment when he finally lost Flanders by the death of Artevelde, who was killed by the people of Ghent in 1345. Under the influence of Godfrey d'Harcoeur, Philip VI. had wished to destroy on account of his ambitions with regard to the duchy of Normandy, Edward III. now invaded central France, ravaged Normandy, getting as near to Paris as Saint-Germain; and profiting by Philip VI.'s hesitation and delay, he reached the north with his spoils by dint of forced marches. Having been pursued and encountered at Crécy, Edward gained a complete victory there on the 26th of August 1346. The seizure of Calais in 1347, despite heroic resistance, gave the English a port where they could always find entry into France, just when the queen of England had beaten David of Scotland, the ally of France, at Neville's Cross, and when Charles of Blois, made prisoner in his turn, was held captive in London. The Black Death put the finishing touch to the military disasters and financial upheavals of this unlucky reign; though before his death in 1350 Philip VI. was fortunate enough to augment his territorial acquisitions by the purchase of the rich port of Montpellier, as well as by that of Dauphiné, which extended to the Alpine frontier, and was to become the appanage of the eldest son of the king of France (see DAUPHINÉ and DAUPHIN). Philip VI.'s successor was his son John the Good—or rather, the stupid and the spendthrift. This noble monarch was un speakably brutal (as witness the murders, simply on suspicion, of the constable Raoul de Brienne, count of Eu, and of the count of Harcourt) and incredibly extravagant. His need of money led him to debase the currency eighty-one times between 1350 and 1355. And this money, so necessary for the prosecution of the war with England, which had been interrupted for a year, thanks to the pope's intervention, was lavished by him upon his favourite, Charles of La Cerda. The latter was murdered in 1354 by order of Charles of Navarre, the king's son-in-law, who also prevented the levying of the taxes voted by the states in 1355 with the object of replenishing the treasury. The Black Prince took this opportunity to ravage the southern provinces, and then marched to join the duke of Lancaster and Charles of Navarre in Normandy. John the Good managed to bring the English army to bay at Maupertuis, not far from Poitiers; but the battle was conducted with such a want of intelligence on his part that the French army was overwhelmed, though very superior in numbers, and King John was made prisoner, after a determined resistance, on the 19th of September 1356.

The disaster at Poitiers almost led to the establishment in France of institutions analogous to those which England owed to Bouvines. The king a prisoner, the dauphin discredited and deserted, and the nobility decimated, the people—that is to say, the states-general—could raise their voice. Philip the Fair had never regarded the states-general as a financial institution, but merely as a moral support. Now, however, in order to obtain substantial help from taxes instead of mere driblets, the Valois needed a strong army corps. War against the English was not sufficient to assure them the support of the nation. Excessive depreciation of the currency and extortionate taxation were ruinous palliatives, and insufficient to supply a treasury which the revenue from crown lands and various rights taken from the nobles could not fill even in times of peace. By the 14th century the motto "N' impose qui ne veut" (i.e. no taxation without consent) was as firmly established in France as in England. After Crécy Philip VI. called the states together regularly, that he might obtain subsidies from them, as an assistance, an "aid" which subjects could not refuse the suzerain. In return for this favour, which the king could not claim as a right, the states, feeling their power, began to bargain, and at the session of November 1355 demanded the participation of all classes in the tax voted, and obtained guarantees both for its levy and the use to be made of it. A similar situation in England had given birth to political liberty; but in France the great crisis of the early 15th century stifled it. It was with this money that John the Good got himself beaten and taken prisoner at Poitiers. Once more the states-general had to be convoked. Confronted by a pale weakly boy like the dauphin Charles and the remnants of the disgraced council, the situation of the states was stronger than ever. Predominant in influence were the deputies from the towns, and above all the citizens of the capital, led by Robert le Coq, bishop of Laon, and Étienne Marcel, provost of the merchants of Paris. Having no cause for confidence in the royal administration, the states refused to treat with the dauphin's councillors, and proposed to take him under their own tutelage. He himself hesitated whether to sacrifice the royal authority, or else, without resources or support, to resist an assembly backed by public opinion. He decided for resistance. Under pretext of
grave news received from his father, and of an interview at Metz with his uncle, the emperor Charles IV., he begged the states to adjourn till the 3rd of November 1356. This was a political coup d'état, and when the time had expired he attempted a financial coup d'état by debasing the currency. An uprising obliged him to call the states-general together again in February 1357, when they transformed themselves into a deliberative, independent and permanent assembly by means of the Grande Ordonnance.

In order to make this great French charter really effective resistance to the royal authority should have been collective, national and even popular, as in the case of the charters of 1215 and 1258 in England. But the lay and ecclesiastical feudal lords continued to show themselves in France, as everywhere else except across the Straits of Dover, a cause of division and oppression. Moreover, the states were never really general; those of the Langue d'oc and the Langue d'oïl sometimes acted together; but there was never a common understanding between them and always two Francs in the kingdom. Besides, they only represented the three classes who alone had any social standing at that period: the nobles, the clergy, and the bourgeois of important towns. Étienne Marcel himself protested against councillors "de petit état." Again, the states, intermittently convoked according to the king's good pleasure, exercised neither periodicity nor effective control, but fulfilled a duty which was soon felt as onerous. Indifference and satiety spread speedily; the bourgeoisie forsook the reformers directly they had recourse to violence (February 1358), and the Parisians became hostile when Étienne Marcel complicated his revolutionary work by intrigues with Navarre, releasing from prison the grandson of Louis X., the Headstrong, an ambitious, fine-spoken courter of popularity, covetous of the royal crown. The dauphin's flight from Paris excited a wild outbreak of monarchist loyalty and anger against the capital among the nobility and in the states-general of Compiègne. Marcel, like the dauphin, was not a man to turn back. But neither the support of the peasant insurgents—the "Jacques"—who were annihilated in the market of Meaux, nor a last but unheeded appeal to the large towns, nor yet the uncertain support of Charles the Bad, to whom Marcel in despair proposed to deliver up Paris, saved him from being put to death by the royalist party of Paris on the 31st of July 1358.

Isolated as he was, Étienne Marcel had been unable either to seize the government or to create a fresh one. In the reaction which followed, his own control of the royal authority was soon dissolved, and the state had to appeal once more to great men, who, for the most part, continued to govern as they had before.

The treaty of Brétigny.

Charles V. (1364-1380)

Charles V., whose birth and death were celebrated in the ballads as the "king of the poets," was the first of the Burgundian line to marry into the royal family of Portugal. He married the Infanta Beatrice, daughter of John I. of Portugal, and the union was childless. The marriage was made with the view of securing for the crown of France a claim to the crown of Portugal, which had been held by the house of Castile since the fall of the Alphonso X. The marriage was celebrated in 1362, and the union was dissolved by the death of the king of Portugal in 1383. The treaty of Brétigny, which was signed in 1360, provided for the division of the kingdom of Navarre between the French and the English. The French were to have the west half of the kingdom, and the English the east half. The treaty was ratified by the king of France in 1360, but it was not ratified by the king of England until 1365.

The revolt of the Mallotins.

The Mallotins of Paris were a group of peasants who rebelled against the agricultural taxes imposed by the crown. They were led by a man named Mallot, who claimed to be the rightful heir to the throne of France. The Mallotins were defeated by the army of Charles V., and the leader was executed. The revolt was put down with great cruelty, and many of the peasants were put to death. The revolt of the Mallotins was a tragic episode in the history of France, and it showed the continuing conflict between the crown and the peasantry.
policy to such a point that on the return of a last unfortunate expedition into Gelderland Charles VI., who had been made by him to marry Isabel of Bavaria, took the government from his uncles on the 3rd of May 1389, and recalled the Marmousets. But this young king, aged only twenty, very much in love with his young wife and excessively fond of pleasure, soon wrecked the delicate poise of his mental faculties in the festivities of the Hôtel Saint-Paul; and a violent attack of Pierre de Craon on the constable de Clisson having led to an expedition against his accomplice, the duke of Brittany, Charles was seized by incacity on the road. The Marmousets were deposed, the king's brother, the duke of Orleans, set aside, and the old condition of affairs began again (1392).

The struggle was now between the two branches of the royal family, the Orleanist and the Burgundian, between the aristocratic south and the democratic north; while the deposition of Richard II. of England in favour of Henry of Lancaster permitted them to vary civil war by war against the foreigner. Philip the Bold, duke of Burgundy, the king's uncle, had certain advantages in his rival Louis of Orleans, Charles VI.'s brother: superiority in age, relations with the Lancastrians and with Germany, and territorial wealth and power. The two adversaries had each the same scheme of government: each wanted to take charge of Charles VI., who was intermittently insane, and to exclude his rival from the pillage of the royal exchequer; but this rivalry of desires brought them into opposition on all the great questions of the day—the war with England, the Great Schism and the imperial election. The struggle became acute when John the Fearless of Burgundy succeeded his father in 1404. Up to this time the queen, Isabel of Bavaria, had been held in a kind of dependency upon Philip of Burgundy, who had brought about her marriage; but less eager for influence than for money, since political questions were unintelligible to her and her situation was a precarious one, she suddenly became favourable to the duke of Orleans. Whether due to passion or caprice this cost the duke his life, for John the Fearless had him assassinated in 1407, and thus let loose against one another the Burgundians and the Armagnacs, so-called because the son of the daughter of John the Fearless was the count of Armagnac (see ARMAGNAC). Despite all attempts at reconciliation the country was divided into two parties. Paris, with her tradesmen—the butchers in particular—and her university, played an important part in this quarrel; for to be master of Paris was to be master of the king. In 1413 the duke of Burgundy gained the upper hand there, partly owing to the rising of the Cabochiens, i.e. the butchers led by the skinner Simon Caboche, partly to the hostility of the university to the Avignon pope and partly to the Parisian bourgeoisie.

Amid this reign of terror and of revolt the university, the only moral and intellectual force, taking the place of the impotent states-general and of a parlement carefully restricted to the judiciary sphere, vainly tried to re-establish a firm monarchical system by means of the Ordonnance Cabochienne; but this had no effect, the government being now at the mercy of the mob, themselves at the mercy of incapable hot-headed leaders. The struggle ended in becoming one between factions of the towns, led respectively by the huchier Cirasse and by Jean Caboche. The former overwhelmed John the Fearless, who fled from Paris; and the Armagnacs, re-entering on his exit, substituted white terror for red terror, from the 12th of December 1413 to the 28th of July 1414. The butchers' organization was suppressed and all hope of reform lost. Such disorders allowed Henry V. of England to take the offensive again.

The Armagnacs were in possession of Paris and the king when Henry V. crushed them at Agincourt on the 25th of October 1415. It was as at Crécy and Poitiers; the French chivalry, accustomed to mere playing at battle in the tournaments, no longer knew how to fight. Charles of Orleans being a captive and his father-in-law, the count of Armagnac, highly unpopular, John the Fearless, hitherto prudentiy neutral, re-entered Paris, amid scenes of carnage, on the invitation of the citizen Perrinet le Clerc.

Secure from interference, Henry V. had occupied the whole of Normandy and destroyed in two years the work of Philip Augustus. The duke of Burgundy, feeling as incapable of coming to an understanding with the masterful Englishman as of resisting him unaided, tried to effect a reconciliation with the Armagnacs, who had with them the heir to the throne, the dauphin Charles; but his assassination at Montereau in 1410 nearly caused the destruction of the kingdom, the whole Burgundian party going over to the side of the English. By the treaty of Troyes (1420) the son of John the Fearless, Philip the Good, in order to avenge his father recognized Henry V. (now married to Catherine, Charles VI.'s daughter) as heir to the crown of France, to the detriment of the dauphin Charles, who was disavowed by his mother and called in decision “the soi-disant dauphin of Viennois.” When Henry V. and Charles VI. died in 1422, Henry VI.—son of Henry V. and Catherine—was proclaimed at Paris king of France and of England, with the concurrence of Philip the Good, duke of Burgundy, who thus became master of eastern and northern France, as far as the Loire; while the two most important civil powers of the time, the parlement and the university of Paris, had acknowledged the English king.

But the cause of greatest weakness to the French party was still Charles VII. himself, the king of Burgundy. This youth of nineteen, the ill-omened son of a madman and of a Bavarian of loose morals, was a symbol of France, long timorous and mistrustful. The châteaux of the Loire, where he led a restless and enervating existence, held an atmosphere little favourable to enthusiasm and energy. After his victories at Cravant (1430) and Verneuil (1424), the duke of Bedford, appointed regent of the kingdom, had given Charles VII. four years' respite, and these had been occupied in violent intrigues between the constable de Richemont and the sire de la Trémoille, the young king's favourites, and solely desirous of enriching themselves at his expense. The king, melancholy spectacle as he was, seemed indeed to suit that tragic hour when Orleans, the last bulwark of the south, was besieged by the earl of Salisbury (1428) and crushed in the battle of Verneuil (1428). He had neither taste nor capacity like Philip VI. or John the Good for undertaking “belles apertures d'armes”; but a lack of chivalry combined with a temporizing policy had not been particularly unsuccessful in the case of his grandfather Charles V.

Powerful aid now came from an unexpected quarter. The war had been long and cruel, and each successive year naturally increased feeling against the English. The damage done to Burgundian interests by the harsh, yet impotent government of Bedford, disgust at the iniquitous treaty of Troyes, the monarchist loyalty of many of the warriors, the still deeper sentiment felt by men like Alain Chartier towards “Dame France,” and the “great misery that there was in the kingdom of France”; all these suddenly became incarnate in the person of Joan of Arc, a young peasant of Domrémy in Lorraine. Determined in her faith and proud in her meekness, in opposition to the timid counsels of the military leaders, to the prescribed delays of the courtiers, to the scruples of the experts and the quarrelling of the barons, she quoted her “voices,” who had, she said, commissioned her to raise the siege of Orleans and to conduct the gentle dauphin to Reims, there to be crowned. Her sublime folly turned out to be wiser than their wisdom; in two months, from May to July 1429, she had freed Orleans, destroyed the prestige of the English army at Patay, and dragged the doubting and passive king against his will to be crowned at Reims. All this produced a marvellous revulsion of political feeling throughout France, Charles VII. now becoming incontestably “him to whom the kingdom of France ought to belong.” After Reims Joan's first thought was for Paris, and to achieve the final overthrow

---

1 Earl of Richmond; afterwards Arthur, duke of Brittany (q.v.)
of the English; while Charles VII. was already sighing for the easy life of Touraine, and recurrying to that policy of truce which was so strongly urged by his counsellors, and so keenly irritating to the clear-sighted Joan of Arc. A check before Paris allowed the jealousy of La Trémoïle to waste the heroine for eight months on operations of secondary importance, until the day when she was captured by the Burgundians under the walls of Compiègne, and sold by them to the English. The latter incontinently prosecuted her as a heretic; they had, indeed, a great interest in seeing her condemned by the Church, which would render her conquests sacrilegious. After a scandalous four months' duel between this simple innocent girl and a tribunal of crafty malevolent ecclesiastics and doctors of the university of Paris, Joan was burned alive in the old market-place of Rouen, on the 30th of May 1431 (see Joan of Arc).

On Charles VII.'s part this meant oblivion and silence until the day when in 1430, more for his own sake than for hers, he caused her memory to be rehabilitated; but Joan had given the country a new life and heart. From 1431 to 1454 the struggle against the English went on energetically; and the king, relieved in 1433 of his evil genius, La Trémoïle, then became a man once more, put the kingdom under the guidance of Dunois, Richemont, La Hire and Saintrailles, leaders of worth on the field of battle. Moreover, the English territory, a great triangle, with the channel for base and Paris for apex, was not a really solid position. Yet the war seemed interminable; until at last Philip of Burgundy, for long embarrassed by his English alliance, decided in 1435 to become reconciled with Charles VII. This was in consequence of the death of his sister, who had been married to Bedford, and the return of his brother-in-law Richemont into the French king's favour. The treaty of Arras, which made him a sovereign prince for life, though, at all events gave united France the opportunity of expelling the English from the east, and allowed the king to re-enter Paris in 1436. From 1436 to 1439 there was a terrible repetition of what happened after the Peace of Brétigny; famine, pestilence, extortion and, later, the aristocratic revolt of the Frangueire, completed the ruin of the country. But thanks to the permanent tax of the taille during this time of truce Charles VII. was able to effect the great military reform of the Compagnies d'Ordonnance, of the French Archers, and of the artillery of the brothers Bureau. From this time forward the English, ruined, demoralized and weakened both by the death of the duke of Bedford and the beginnings of the Wars of the Roses, continued to lose territory on every recurrence of conflict. Normandy was lost to them at Formigny (1450), and Guienne, English since the 12th century, at Castillon (1453). They kept only Calais; and now it was their turn to have a madman, Henry VI., for king.

France issued from the Hundred Years' War victorious, but terribly ruined and depopulated. It is true she had definitely freed her territory from the stranger, and through the sorrows of defeat and the menace of disruption had fortified her national solidarity, and defined her patriotism, still involved in and not yet dissociated from loyalty to the monarchy. A happy awakening, although it went too far in establishing royal absolutism; and a victory too complete, in that it enervated all the forces of resistance. The nation, worn out by the long disorders consequent on the captivity of King John and the insanity of Charles VI., abandoned itself to the joys of peace. Preferring the solid advantage of orderly life to an unstable liberty, it acquiesced in the abdication of 1439, when the States consented to taxation for the support of a permanent army without any periodical renewal of their authorization. No doubt by the prohibition to levy the smallest taille the feudal lords escaped direct taxation; but from the day when the privileged classes selfishly allowed the taxing of the third estate, provided that they themselves were exempt, they opened the door to monarchic absolutism. The principle of autocracy triumphed everywhere over the remnants of local or provincial authority, in the sphere of industry as in that of administration; while the gild system became much more rigid. A loyal bureaucracy, far more powerful than the phantom administration of Bourges or of Pottiers, gradually took the place of the court nobility; and thanks to this the institutions of control which the war had called into power—the provincial states-general—were nipped in the bud, withered by the people's poverty of political idea and by the blind worship of royalty. Without the nation's concurrence the king's creatures were now to endow royalty with all the organs necessary for the exertion of authority; by which imprudent compliance, and above all thanks to Jacques Cœur (q.v.), the financial independence of the provinces disappeared; little by little, and all the public revenues were left at the discretion of the king alone (1436-1440). By this means, too, and chiefly owing to the constable de Richemont and the brothers Bureau, the first permanent royal army was established (1445).

Henceforward, strengthened by victory and organized for the struggle, was able to reduce the centrifugal social forces to impotence. The parlement of Paris saw its monopoly encroached upon by the court of Toulouse in 1443, and by the parlement of Grenoble in 1453. The university of Paris, compromised with the English, like the parlement, sanctioned the institution and growth of privileged provincial universities. The nation was isolated from the papacy by the Pragmatic Sanction of Bourges (1438) only to be exploited and enslaved by royalty. Monarchical centralization, interrupted for the moment by the war, took up with fresh vigour its attacks upon urban liberties, especially in the always more independent south. It caused a slackening of that spirit of communal initiative which had awakened in the midst of unprecedented disasters. The decimated and impoverished nobility proved their impotence in the coalitions they attempted between 1437 and 1442, of which the most important, the Praguerie, fell to pieces almost directly, despite the support of the dauphin himself.

The life of society, now alarmingly unstable and ruthlessly cruel, was symbolized by the danse macabre painted on the walls of the cemeteries; the sombre and tragic art of the 15th century, having lost the fine balance shown by that of the 13th, gave expression in its morbid realism to the general state of exhaustion. The material subject of the arts and of other artistic manifestations was no longer the triumphant Christ of the middle ages, nor the smiling and teaching Christ of the 13th century, but the Man of sorrows and of death, the naked bleeding Jesus, lying on the knees of his mother or crowned with thorns. France, like the Christ, had known all the bitterness and weakness of a Passion.

The war of independence over, after a century of fatigue, regrets and doubts, royalty and the nation, now more united and more certain of each other, resumed the methodic and utilitarian war of widening boundaries. Leaving dreams about crusades to the poets, and to a papacy delivered from schism, Charles VII. turned his attention to the ancient appanage of Lothair, Alsace and Lorraine, those lands of the north and the east whose frontiers were constantly changing, and which seemed to invite aggression. But the chance of annexing them without great trouble was lost; by the fatal custom of appanages the Valois had set up again those feudal institutions which the Capets had found such difficulty in destroying, and Louis XI. was to make sad experiments of this.

To the north and east of the kingdom extended a wide territory of uncertain limits; countries without a chief like Alsace; principalities like Lorraine, ecclesiastical lordships like the bishopric of Liége; and, most important of all, a royal appanage, that of the duchy of Burgundy, which dated back to the time of John the Good. Through marriages, conquests and inheritance, the dukes of Burgundy had enormously increased their influence; while during the Hundred Years' War they had benefited alternately by their criminal alliance with the English and by their self-interested reconciliation with their sovereign. They soon
appeared the most formidable among the new feudal chiefs so imprudently called into being by Louis XI.'s predecessors. Fleeing from the paternal wrath which he had drawn down upon himself by his ambition and by his unauthorized marriage with Charlotte of Savoy, the future Louis XI. had passed five years of voluntary exile at the court of the chief of the House of Burgundy, Philip the Good; and he was able to appreciate the territorial power of a duchy which extended from the Zuyder Zee to the Somme, with all the country between the Saône and the Loire in addition, and its geographical position as a commercial intermediary between Germany, England and France. He had traversed the fertile country of Flanders; he had visited the rich commercial and industrial republics of Bruges and Ghent, which had escaped the disasters of the Hundred Years' War; and, finally, he had enjoyed a hospitality as princely as it was self-interested at Brussels and at Dijon, the two capitals, where he had seen the brilliancy of a court unique in Europe for the ideal of chivalric life it offered.

But the dauphin Louis, although a bad son and impatient for the crown, was not dazzled by all this. With very simple tastes, an inquiring mind, and an imagination always at work, he combined to cast in easy good humor, which inspired confidence, and, though inclined in spending money on himself, he could be lavish in buying men either dangerous or likely to be useful. More inclined to the subtleties of diplomacy than to the risks of battle, he had recognized and speedily grasped the disadvantages of warfare. The duke of Burgundy, however rich and powerful, was still the king's vassal; his wide but insecure authority, of too rapid growth and unpopular, lacked sovereign rights. Hardly, therefore, had Louis XI. heard of his father's death than he made his host aware of his perfectly independent spirit, and his very definite intention to be master in his own house.

But by a kind of poetic justice, Louis XI. had for seven years, from 1465 to 1472, to struggle against fresh Pragueries, called Leagues of the Public Weal (presumably from their disregard of it), composed of the most powerful French nobles, to whom he had set the example of revolt. His first proceedings had indeed given no promise of the moderation and prudence afterwards to characterize the chance to ousting all parties; the officials of his father, "the well-served," whom he dismissed in favour of inferiors like Jean Balue, Olivier le Daim and Tristan Lermont; the clergy, by abrogating the Pragmatic Sanction; the university of Paris, by his ill-treatment of it; and the nobles, whom he deprived of their hunting rights, among them being those whom Charles VII. had been most careful to conciliate in view of the inevitable conflict with the duke of Burgundy—in particular, Francis II., duke of Brittany. The repurchase in 1463 of the towns of the Somme (to which Philip the Good, now grown old and engaged in a quarrel with his son, the count of Charolais, had felt obliged to consent on consideration of receiving four hundred thousand gold crowns), and the intrigues of Louis XI. during the periodical revolts of the Liégeois against their prince-bishop, set the powder alight. On three different occasions (in 1465, 1467 and 1472), Louis XI.'s own brother, the duke of Berry, urged by the duke of Brittany, the count of Charolais, the duke of Bourbon, and the other feudal lords, attempted to set up six kingdoms in France instead of one, and to impose upon Louis XI. a regency which should give them enormous pensions. This was their idea of Public Weal.

Louis XI. won by his favourite method, diplomacy rather than arms. At the time of the first league, the battle of Monthéry (16th of July 1465) having remained undecided between the two equally badly organized armies, Louis XI. conceded everything in the treaties of Conflans and Saint-Mauro—promises costing him little, since he had no intention of keeping them. But during the course of the second league, provoked by the recapture of Normandy, which he had promised to his brother in exchange for Berry, he was nearly caught in his own trap. On the 15th of June 1467 Philip the Good died, and the accession of the count of Charolais was received with popular risings. In order to embarrass him Louis XI. had secretly encouraged the people of Liége to revolt; but preoccupied with the marriage of Charles the Bold with Margaret of York, sister of Edward IV. of England, he wished to negotiate personally with him at Péronne and hardly had he reached that place when news arrived there of the revolt of Liége amid cries of "Vive France." Charles the Bold, proud, violent, pugnacious, as treacherous as his rival, a hardy soldier, though without his political sagacity, imprisoned Louis in the tower where Charles the Simple had died as a prisoner of the count of Vermandois. He only let him depart when he had sworn in the treaty of Péronne to fulfill the engagements made at Conflans and Saint-Mauro to assist in person at the subjugation of rebellious Liége, and to give Champagne as an appanage to his ally the duke of Berry.

Louis XI., supported by the assembly of notables at Tours (1470), had no intention of keeping this last promise, since the duchy of Champagne would have made a bridge between Burgundy and Flanders—the two isolated branches of the house of Burgundy. He gave the duke of Berry distant Guienne. But death eventually rid him of this duke, who was himself a problem, since he was being organized, the object of which was to make the duke of Berry king with the help of Edward IV., king of England. The duke of Brittany, Francis II., was defeated; Charles the Bold, having failed at Beauvais in his attempt to recapture the towns of the Somme which had been promised him by the treaty of Conflans, was obliged to sign the peace of Senlis (1472). This was the end of the great feudal coalitions, for royal vengeance soon settled the account of the lesser vassals; the duke of Alençon was condemned to prison for life; the count of Armagnac was killed; and the "Germans" were soon to dismember Louis of Charles the Bold.

Charles had indeed only signed the peace so promptly because he was looking eastward towards that royal crown and territorial cohesion of which his father had also dreamed. The king, he said of Louis XI., is always ready. He wanted to provide his future sovereignty with organs analogous to those of France; a permanent army, and a judiciary and financial administration modelled on the French parliament and exchequer. Since the death of the last remaining kingdom of France, his only course was to reconstitute the ancient kingdom of Lotharingia; while the conquest of the principality of Liége and of the duchy of Gelderland, and the temporary occupation of Alsace, pledged to him by Sigismund of Austria, made him greedy for Germany. To get himself elected king of the Romans he offered his daughter Mary, his eternal candidate for marriage, to the emperor Frederick III. for his son. Thus either he or his son-in-law Maximilian would have been emperor.

But the Tarpeian rock was a near neighbour of the Capitol. Frederick—distrustful, and in the pay of Louis XI.—evaded a meeting arranged at Trier, and Burgundian influence in Alsace was suddenly brought to a violent end by the putting to death of its tyrannical agent, Peter von Hagenbach. Charles thought to repair the rebuff of Trier at Cologne, and wasted his resources in an attempt to win over its elector by besieging the insignificant town of Neuss. But the "universal spider"—as he called Louis XI.—was weaving his web in the darkness, and was eventually to entangle him in it. First came the reconciliation in his kingdom of these irreconcilables, the Swiss and Sigismund of Austria; and then the union of both with the duke of Lorraine, who was also disturbed at the duke of Burgundy's ambition. In vain Charles tried to kindle anew the embers of former feudal intrigues; the execution of the duke of Nemours and the count of Saint Pol cooled all enthusiasm. In vain did he get his dilatory friends, the English Yorkists, to cross the Channel; on the 20th of August 1475, at Picquigny, Louis XI. bribed them with a sum of seventy-five thousand crowns to forsake him, Edward further undertaking to guarantee the loyalty of the duke of Brittany. Exasperated, Charles attacked and took Nancy,
France

wishing, as he said, "to skin the Bernese bear and wear its fur." To the haggling of the brave garrison of Granson the Swiss responded by terrible reprisals at Granson and at Morat (March to June 1476); while the people of Lorraine finally routed Charles at Nancy on the 5th of January 1477, the duke himself falling in the battle.

The central administration of Burgundy soon disappeared, swamped by the resurgence of ancient local liberties; the army fell to pieces; and all hope of joining the two limbs of the great eastern duchy was definitely lost. As for the remnants that were left, French provinces and imperial territory, Louis XI. claimed the whole. He seized everything, allowing different rights in each place; but he displayed such violent haste and such trickery that he threw the heireness of Burgundy, in despair, into the arms of Maximilian of Austria. At the treaty of Arras (December 1482) Louis XI. received only Picardy, the Bouonnais and Burgundy; by the marriage of Charles the Bold's daughter the rest was annexed to the Empire, and later to Spain. Thus by Louis XI.'s short-sighted error the house of Austria established itself in the Low Countries. An age-long alliance in the interests of France and Burgundy was the result of this disastrous marriage; and as the son who was its issue espoused the heireness of a now unified Spain, France, hemmed in by the Spaniards and by the Empire, was henceforward to encounter them everywhere in her course. The historical progress of France was once more endangered.

The reasons of state which governed all Louis XI.'s external policy also inspired his internal administration. If they justified him in employing lies and deception in international affairs, in his relations with his subjects they led him to regard as lawful everything which favoured his authority; no question of right could weigh against it. The army and taxation, as the two chief means of domination within and without the kingdom, constituted the main bulwarks of his policy. As for the nobility, his only thought was to diminish their power by multiplying their number, as his predecessors had done; while he reduced the rebels to submission by his iron cages or the axe of his gossip Tristan Lermitte. The Church was treated with the same unconcerned cynicism; he held her in strict tutelage, accentuating her moral decadence still further by the manner in which he set aside or re-established the Pragmatic Sanction, according to the fluctuations of his financial necessities or his Italian ambitions. It has been said that on the other hand he was a king of the common people, and certainly he was one of them in his simple habits, in his taste for rough pleasantry, and above all in his religion, which was limited to superstitious practices and small devotions. But in the states of Tours in 1468 he evoked the same mistrust for fiscal control by the people as for the privileges of the nobility. He inaugurated that autocratic rule which was to continue gaining strength until Louis XV.'s time. Louis XI. was the king of the bourgeoisie; he exacted much from them, but paid them back with interest by allowing them to reduce the power of all who were above them and to lord it over all who were below. As a matter of fact Louis XI.'s most faithful ally was death. Saint-Pol, Nemours, Charles the Bold, his brother the Duke of Berry, old René d'Anjou and his nephew the Count of Maine, heir to the riches of Provence and to rights over Naples—the skeleton hand moved down all his adversaries as though it too were in his pay; until the day when at Plessis-Tours it struck a final blow, claimed its just dues from Louis XI., and carried him off despite all his relics on the 30th of August 1483.

There was nothing noble about Louis XI. but his aims, and nothing great but the results he attained; yet however different he might have been he could not have done better, for what he achieved was the making of France. This was soon seen after his death in the reaction which menaced his work and those who had served him; but thanks to himself and to his true successor, his eldest daughter Anne, married to the sire de Beaujeu, a younger member of the house of Bourbon, the set-back was only partial. Strife began immediately between the numerous malcontents and the Beaujeu party, who had charge of the little Charles VIII. These latter prudently made concessions: reducing the taille, sacrificing some of Louis XI.'s creatures to the rancour of the parlement, and restoring a certain number of offices to land to the hostile princes (chief of whom was the duke of Orleans), and even consenting to a convocation of the states-general at Tours (1484). But the elections having been favourable to royalty, the Beaujeu family made the states reject the regency desired by the duke of Orleans, and organize the king's council after their own views. When they subsequently eluded the conditions imposed by the states, the deputies—nobles, clergy and burgesses—showed their incapacity to oppose the progress of despotism. In vain did the malcontent princes attempt to set up a new League of Public Weal, the Guerre folle (Mad War), in which the duke of Brittany, Francis II., played the part of Charles the Bold, dragging in the people of Lorraine and the king of Navarre. In vain did Charles VIII., his majority attained, at once abandon the treaty of Cabil: the province gained by the victory of Saint-Aubin du Cormier (1488). In vain did Henry VII. of England, Ferdinand the Catholic, and Maximilian of Austria try to prevent the annexation of Brittany by France; its heiress Anne, deserted by every one, made peace and married Charles VIII. in 1491. There was no longer a single great fief in France to which the malcontents could fly for refuge.

It now remained to consolidate the later successes attained by the policy of the Valois—the acquisition of the duchies of Burgundy and Brittany; but instead there was a sudden change and that policy seemed about to be lost in dreams of recapturing the rights of the Angevins over Naples, and conquering Constantinople. Charles VIII., a prince with neither intelligence nor resolution, his head stuffed with chivalric romance, was scarcely freed from his sister's control when he sought in Italy a fatal distraction from the struggle with the house of Austria. By this "war of magnificence" he caused an interruption of half a century in the growth of national sentiment, which was only revived by Henry II.; and he was not alone in thus leaving the bone for his contemporaries. Ferdinand the Catholic when delivered from the Moors, and Henry VII. from the power of the English nobles, followed the same superficial policy, not taking the trouble to work for that real strength which comes from the adhesion of willing subjects to their sovereign. They only cared to aggravize themselves, without thought of national feeling or geographical conditions. The great theorist of these "conquistadores" was Machiavelli. The regent, Anne of Beaujeu, worked in her daughter's interest to the detriment of the kingdom, by means of a special treaty destined to prevent the property of the Bourbons from reverting to the crown; while Anne of Brittany did the like for her daughter Claude. Louis XII., the next king of France, thought only of the Milanese; Ferdinand the Catholic all but destroyed the Spanish unity at the end of his life by his marriage with Germaine de Foix; while the house of Austria was for centuries to remain involved in this petty course of policy. Ministers followed the example of their self-seeking masters, thinking it no shame to accept pensions from foreign sovereigns. The pondering consideration everywhere was direct material advantage; there was disproportion everywhere between the means employed and the poverty of the results, a contradiction between the interests of the sovereigns and those of their subjects, which were associated by force and not naturally blended. For the sake of a morsel of Italian territory every one forgot the permanent necessity of opposing the advance of the Turkish crescent, the two horns of which were impinging upon Europe on the Danube and on the Mediterranean.

Italy and Germany were two great tracts of land at the mercy of the highest bidder, rich and easy to dominate, where these coarse and alien kings, still reared on medieval traditions, were for fifty years to gratify their love of conquest. Italy was their
first battlefield; Charles VIII. was summoned thither by Lodovico II Moro, tyrant of Milan, involved in a quarrel with his rival, Ferdinand II. of Aragon. The Aragonese had snatched the kingdom of Naples from the French house of Anjou, whose claims Louis XI. had inherited in 1480. To safeguard himself in the rear Charles VIII. handed over Rossoullion and Cerdaigne (Cerdaña) to Ferdinand the Catholic (that is to say, all the profits of Louis XI.'s policy); gave enormous sums of money to Henry VII. of England; and finally, by the treaty of Senlis ceded Artois and Franche-Comté to Maximilian of Austria. After these foul's bargains the paladin set out for Naples in 1494. His journey was long and triumphant, and his return precipitate; indeed it very nearly ended in a disaster at Fornovo, owing to the first of those Italian holy leagues which at the least sign of friction were ready to turn against France. At the age of twenty-eight, however, Charles VIII. died without issue (1498).

The accession of his cousin, Louis of Orleans, under the title of Louis XII., only involved the kingdom still further in this Italian imbroglio. Louis did indeed add the fief of Orleans to the royal domain and hastened to divorce Jeanne of France in order to marry Anne, the widow of his predecessor, so that he might keep Brittany. But he complicated the Naples affair by claiming Milan in consideration of the marriage of his grandfather, Louis of Orleans, to Valentina, daughter of Gian Galeazzo Visconti, duke of Milan. In 1499, appealed to by Venice, and encouraged by his favourite, Cardinal d'Amboise (who was hoping to succeed Pope Alexander VI.), and also by Cesare Borgia, who had lofty ambitions in Italy, Louis XII. conquered Milan in seven months and held it for fourteen years; while Lodovico Sforza, betrayed by his Swiss mercenaries, died a prisoner in France. The kingdom of Naples was still left to recapture; and fearing to be thwarted by Ferdinand of Aragon, Louis XII. proposed to this master of roguery that they should divide the kingdom according to the treaty of Granada (1500). But no sooner had Louis XII. assumed the title of king of Naples than Ferdinand set about despoothing him of it, and despite the bravery of a Bayard about Louis d' Ars, Louis XII., being also betrayed by the pope, lost Naples for good in 1504. The treaties of Blois occasioned a vast amount of diplomacy, and projects of marriage between France and Charles of Austria, which came to nothing but served as a prelude to the later quarrels between Bourbons and Habsburgs.

It was Pope Julius II. who opened the gates of Italy to the horrors of war. Profiting by Louis XII.'s weakness and the emperor Maximilian's strange capricious character, this martial pope sacrificed Italian and religious interests alike in order to re-establish the temporal power of the papacy. Jealous of Venice, at that time the Italian state best provided with powers of expansion, and unable to subjugate it single-handed, Julius succeeded in obtaining help from France, Spain and the Empire. The league of Cambrai (1508) was his finest diplomatic achievement. But he wanted to be sole master of Italy; so in order to expel the French "barbarians" whom he had brought in, he appealed to his German barbarians who were far more dangerous—Spaniards, Germans and Swiss—to help him against Louis XII., and stabbed him from behind with the Holy League of 1511.

Weakened by the death of Cardinal d'Amboise, his best counsellor, Louis XII. tried vainly in the assembly of Tours and in the unsuccessful council of Pisa to alienate the French clergy from a papacy which was now so little worthy of respect. But even the splendid victories of Gaston de Foix could not shake that formidable coalition; and despite the efforts of Bayard, La Palice and La Trémoille, it was the Church that triumphed. Julius II. died in the hour of victory; but Louis XII. was obliged to evacuate Milan, to which he had sacrificed everything, even France itself, with that political stupidity characteristic of the first Valois. He died almost immediately after this, on the 1st of January 1515, and his subjects, recognizing his thrift, his justice and the secure prosperity of the kingdom, forgot the seventeen years of war in which they had not been consulted, and rewarded him with the fine title of Father of his People.

As Louis XII. left no son, the crown devolved upon his cousin and son-in-law the count of Angoulême, Francis I. No sooner king, Francis, in alliance with Venice, renewed the chimerical attempts to conquer Milan and Naples; also cherishing dreams of his own election as emperor and of a partition of Europe. The heroic episode of Marignano, when he defeated Cardinal Schinner's Swiss troops (15-15 of September 1515), made him master of the duchy of Milan and obliged his adversaries to make peace. Leo X., Julius II.'s successor, by an astute volte-face exchanged Parma and the Concordat for a guarantee of all the Church's possessions, which meant the defeat of French plans (1515). The Swiss signed the permanent peace which they were to maintain until the Revolution of 1789; while the emperor and the king of Spain recognized Francis II.'s very precarious hold upon Milan. Once more the French monarchy was pulled up short by the indignation of all Italy (1519).

The question now was how to occupy the military activity of a young, handsome, chivalric and gallant prince, "ondoyant divers," intoxicated by his first victory and his tardy accession to fortune. This had been hailed with joy by all who had been his comrades in his days of difficulty; by his mother, Louise of Savoy, and his sister Marguerite; by all the rough young soldiery; by the nobles, tired of the bourgeois ways of Louis XI. and the patriarchal simplicity of Louis XII.; and finally by all the aristocracy who expected now to have the government in their own hands. So instead of heading the crusade against the Turks, Francis threw himself into the electoral contest at Frankfurt, which resulted in the election of Charles V., heir of Ferdinand the Catholic, Spain and Germany thus becoming unified. Pope Leo X., moreover, handed over three-quarters of Italy to the new emperor in exchange for Luther's condemnation, thereby kindling that rivalry between Charles V. and the king of France which was to embroil the whole of Europe throughout half a century (1519-1559), from Pavia to St. Quentin.

The territorial power of Charles V., heir to the houses of Burgundy, Austria, Castile and Aragon, which not only arrested the traditional policy of France but hemmed her in on every side; his pretensions to be the head of Christendom; his ambition to restore the house of Burgundy and the Holy Roman Empire; his grave and forceful intellect all rendered rivalry both inevitable and formidable. But the scattered heterogeneity of his possessions, the frequent crippling of his authority by national privileges or by political discords and religious quarrels, his perpetual straits for money, and his cautious calculating character, almost outweighed the advantages which he possessed in the terrible Spanish infantry, the wealthy commerce of the Netherlands, and the inexhaustible mines of the New World. Moreover, Francis I. stirred up enmity everywhere against Charles V., and after each defeat he found fresh support in the patriotism of his objects. Immediately after the treaty of Madrid (1526), which Francis I. was obliged to sign after the division of Pavia and a period of captivity, he did not hesitate between his honour as a gentleman and the interests of his kingdom. Having been unable to win over Henry VIII. of England at their interview on the Field of the Cloth of Gold, he joined hands with Suleiman the Magnificent, the conqueror of Mohács; and the Turkish cavalry, crossing the Hungarian Pusztá, made their way as far as Vienna, while the mercenaries of Charles V., under the constable de Bourbon, were reviving the saturnalia of Alaric in the sack of Rome (1527).

In Germany, Francis I. assisted the Catholic princes to maintain their political independence, though he did not make the capital he might have made of the reform movement. Italy remained faithful to the vanquished in spite of all, while even Henry VIII. of England, who only needed bribing, and Wolsey, accessible to flattery, took part in the temporary coalition. Thus did France, menaced with disruption, embark upon a course of action imposed...
upon her by the harsh conditions of the treaty of Madrid—otherwise little respected—and later by those of Cambrai (1520); but it was not till later, too late indeed, that it was defined and became a national policy.

After having, despite so many reverses and mistakes, saved Burgundy, though not Artois nor Flanders, and joined to the crown lands the domains of the constable of Bourbon who had gone over to Charles V., Francis I. should have had enough of defending other people's independence as well as his own, and should have thought more of his interests in the north and east than of Milan.

Yet between 1531 and 1547 he manifested the same regrets and the same invincible ambition for that land of Italy which Charles V., on his side, regarded as the basis of his strength. Their antagonism, therefore, remained unabated, as also the contradiction of an official agreement with Charles V., combined with secret intrigues with his enemies. Anne de Montmorency, now head of the government in place of the headstrong chancellor Duprat, for four years upheld a policy of reconciliation and of almost friendly agreement between the two monarchs (1531–1535). The death of Francis I.'s mother, Louise of Savoy (who had been instrumental in arranging the peace of Cambrai), the replacement of Montmorency by the bellicose Chabot, and the advent to power of a Burgundian, Granvelle, as Charles V.'s prime minister, put an end to this double-faced policy, which attacked the Calvinists of France while supporting the Lutherans of Germany; made advances to Clement VII. while pretending to maintain the alliance with Henry VIII. (just then consummating the Anglican schism); and sought an alliance with Charles V. without renouncing the possession of Italy. The death of the duke of Milan provoked a third general war (1536–1538); but after the conquest of Savoy and Piedmont and a fruitless invasion of Provence by Charles V., it resulted in another truce, concluded at Nice, in the interview at Aigues-mortes, and in the old contradictory policy of the treaty of Cambrai. This was confirmed by Charles V.'s triumphal journey through France (1539).

Rivalry between Madame d'Etampes, the imperious mistress of the aged Francis I., and Diane de Poitiers, whose ascendency over the dauphin was complete, now brought court intrigues and constant chicanery. Francis I. sold office, to complicate still further this wearisome policy of ephemeral "combinazioni" with English, Germans, Italians and Turks, which urgent need of money always brought to naught. The disillusionment of Francis I., who had hitherto hoped that Charles V. would be generous enough to give Milan back to him, and then the assassination of Rincon, his ambassador at Constantinople, led to a fourth war (1544–1546), in the course of which the king of England went over to the side of Charles V.

Unable in the days of his youth to make Italy French, when age began to come upon him, Francis tried to make France Italian. In his château at Blois he drank greedily of the cup of Renaissance art; but he found the exciting draughts of diplomacy which he imbibed from Machiavelli's Prince even more intoxicating, and he headed the ship of state straight for the rock of absolutism. He had been the first king "du bon plaisir" ("of his own good pleasure")—"Caesar," as his mother Louise of Savoy pronounced—hailed him in 1515—and to a man of his gallant and hot-headed temperament love and war were schools little calculated to teach moderation in government. Italy not only gave him a taste for art and letters, but furnished him with an arsenal of despotic maxims. Yet his true masters were the jurists of the southern universities, passionately addicted to centralization and autocracy, men like Duprat and Poyet, who revived the persistent tradition of Philip the Fair's legists. Gathered together on the council of affairs, they managed to control the policy of the common council, with its too mixed and too independent membership. They successfully strove to separate the grandeur and supertérence of the king "from the rest of the nation; to isolate the nobility amid the seductions of a court lavish in promises of favour and high office; and to win over the bourgeoisie by the buying and selling and afterwards by the hereditary transmission of offices. Thanks to their action, feudalism was attacked in its landed interest in the person of the constable de Bourbon; feudalism in its financial aspect by the execution of superintendent Simblançay and the special privileges of towns and provinces by administrative centralization. The bureaucracy became a refuge for the nobles, and above all for the bourgeois, whose fixed incomes were lowered by the influx of precious metals from the New World, while the wages of artisans rose. All those time-worn medieval institutions which no longer allowed free scope to private or public life were demolished by the legists in favour of the monarchy.

Their masterstroke was the Concordat of 1516, which meant an immense stride in the path towards absolutism. While Germany and England, where ultramontane doctrines had been allowed to creep in, were seeking a remedy among the economic exactions of the papacy in a reform of dogma or in schism, France had supposed herself to have found this in the Pragmatic Sanction of Bourges. But the royal jurists the right of the churches and abbeyes to make appointments to all offices, and the guarantee of liberties valuable to the clergy, but detestable to themselves, because the clergy thus retained the great part of public wealth and authority. By giving the king the ecclesiastical patronage they not only made a docile instrument of him, but endowed him with a mine of wealth, even more productive than the sale of offices, and a power of favouring and rewarding that transformed a needy and ill-owed king into an absolute monarch.

To the pope they offered a mess of pottage in the shape of annates and the right of canonical institution, in order to induce him to sell the Church of France to the king. By this royal reform they completely isolated the monarchy, in the presumptuous pride of omnipotence, upon the ruins of the Church and the aristocracy, despite both the university and the parlement of Paris.

This is explained Francis I.'s preoccupation with Italian adventures in the latter part of his reign, and also the inordinate squandering of money, the autos-da-fé in the provinces and in Paris, the harsh repression of reform and free thought, and the abuse of justice; while the man who became the arbiter and the state was at the mercy of the caprices of royal mistresses—all of which was to become more and more pronounced during the twelve years of Henry II.'s government.

Henry II. shone but with a reflected light—in his private life reflected from his old mistress, Diane de Poitiers, and in his political action reflected from the views of Montmorency or the Guises. He only showed his own personality in an egoism more narrow-minded, in hatred yet bitterer than his father's; or in a haughty and jealous insistence upon an absolute authority which he never had the wit to maintain.

The struggle with Charles V. was at first delayed by differences with England. The treaty of Arles had left two bones of contention: the cession of Boulogne to England and the exclusion of the Scotch from the terms of peace. At last the regent, the duke of Somerset, endeavoured to arrange a marriage between Edward VI. and a minor, and Mary Stuart, who had been offered in marriage to the dauphin Francis by her mother, Marie de Lorraine, a Guise who had married the king of Scotland. The transference of Mary Stuart to France, and the treaty of 1559 which restored Boulogne to France for a sum of 400,000 crowns, suspended the state of war; and then Henry II.'s opposition to the imperial policy of Charles V. showed itself everywhere: in Savoy and Piedmont, occupied by the French and claimed by Philibert Emmanuel, Charles V.'s ally; in Navarre, unlawfully conquered by Ferdinand the Catholic and claimed by the family of Albrecht; in Italy, where, aided and abetted by Pope Paul III., Henry II. was trying to regain support; and, finally, in Germany, where after the victory of Charles V. at Mühlberg (1547) the Protestant princes called Henry II. to their aid, offering to
FRANCE

The Protestant alliance was substituted for the Turkish alliance, and Henry II. hastened to accept the offers made to him (1552); but this was rather late in the day, for the reform movement had produced civil war and evoked fresh forces. The Germans, in whom national feeling got the better of imperialistic ardour, as soon as they saw the French at Strassburg, made terms with the emperor at Passau and permitted Charles to use all his forces against Henry II. The defence of Metz by Francis of Guise was admirable and successful; but in Picardy operations continued their course without much result, owing to the incapacity of the constable de Montmorency. Fortunately, despite the marriage of Charles V.'s son Philip to Mary Tudor, which gave him the support of England (1554), and despite the religious pacification of Germany through the peace of Augsburg (1555), Charles V., exhausted by illness and by thirty years of intense activity, in the truce of Vaucelles abandoned Henry II.'s conquests—Piedmont and the Three Bishoprics. He then abdicated the government of his kingdoms, which he divided between his son Philip II. and his brother Ferdinand (1556). A double victory, this, for France.

Henry II. assumed the war, without provocation and without allies, was a grave error; but more characterless than ever, the king was urged to it by the Guises, whose influence since the defence of Metz had been supreme at court and who were perhaps hoping to obtain Naples for themselves. On the other hand, Pope Paul IV. and his nephew Carlo Caraffa embarked upon the struggle, because as Neapolitans they detested the Spaniards, whom they considered as "barbarous" as the Germans or the French. The constable de Montmorency's disaster at Saint Quentin (August 1557), by which Philip II. had not the wit to profit, was successfully avenged by Guise, who was appointed lieutenant-general of the kingdom. He took Calais by assault in January 1558, after the English had held it for two centuries, and occupied Luxemburg. The treaty of Cateau-Cambrésis (August 1559) finally put an end to the Italian follies, Naples, Milan and Piedmont; but it also lost Savoy, making a gap in the frontier for a century. The question of Burgundy was definitely settled, too; but the Netherlands had stood to be the German Burgundy of its future. The bishoprics and the recapture of Calais an effort towards a natural line of frontier and towards a national policy seemed indicated; but while the old soldiers could not forget Marignano, Ceresole, nor Italy perishing with the name of France on her lips, the secret alliance between the cardinal of Lorraine and Granvela against the Protestant heresy foretold the approaching subordination of national questions to religious differences, and a decisive attempt to purge the kingdom of the new doctrines. The origin and general history of the religious reformation in the 16th century are dealt with elsewhere (see CHURCH HISTORY and REFORMATION). In France it had originally no revolutionary character whatever; it proceeded from traditional Gallican theories and from the innovating principle of humanism, and it began as a protest against Roman decadence and medieval scholasticism. It found its first adherents and its first defenders among the clerics and learned men grouped around Faber (Leffêvre) of Étapes at Meaux; while Marguerite de Navarre, "des Roynes la non pareille," was the indefatigable Maceenas of these innovators, and the incautious step to be taken in their name. The reformers shook off the yoke of systems in order boldly to renounce both knowledge and faith; and, instead of resting on the abstract a priori principles within which man and nature had been imprisoned, they returned to the ancient methods of observation and analysis. In so doing, they separated intellectual from popular life; and acting in this spirit, through the need of a moral renaissance, they reverted to primitive Christianity, substituting the inner and individual authority of conscience for the general and external authority of the Church. Their efforts would not, however, have sufficed if they had not been seconded by events; pure doctrine would not have given birth to a church, nor that to a party; in France, as in Germany, the religious reformation was conditioned by an economic and social revolution.

The economic renaissance due to the great maritime discoveries had the consequence of concentrating wealth in the hands of the bourgeoisie. Owing to their mental qualities, their tendencies and their resources, the bourgeoisie had been, if not alone, at least most apt in profiting by the development of industry, by the extension of commerce, and by the formation of a new and mobile means of enriching themselves. But though the bourgeoisie had acquired through capitalism certain sources of influence, and gradually monopolized municipal and public functions, the king and the peasants had also benefited by this revolution. After a hundred and fifty years of foreign war and civil discord, at a period when order and unity were ardently desired, an absolute monarchy had appeared the only power capable of realizing such aspirations. The peasants, moreover, had profited by the reduction of the idle landed aristocracy; serfdom had decreased or had been modified; and the free peasants were more prosperous, had reconquered the soil, and were selling their produce at a higher price than they everywhere paid less exorbitant rents. The victims of this prosperity were the urban proletariat, whose treatment by their employers in trade became less and less protective and beneficent, and the nobility, straitened in their financial resources, uprooted from their ancient strongholds, and gradually despoiled of their power by a monarchy based on popular support. The unlimited sovereignty of the prince was established upon the ruins of the feudal system; and the capitalism of the merchants and bankers upon the closing of the trade-gilds to workmen, upon severe economic pressure and upon the exploitation of the artisans' labour.

Though reform originated among the educated classes it speedily found an echo among the industrial classes of the 16th century, further assisted by the influence of German and Flemish journeymen. The popular reform-movement was essentially an urban movement; although under Francis I. and Henry II. it had already begun to spread into the country. The artisans, labourers and small shop-keepers who formed the first nucleus of the reformed church were numerous enough to make a religious party, though too few to form a party. Reversing the monarchy and established institutions, they endured forty years of persecution before they took up arms. It only lasted during the second half of Henry II.'s reign that Protestantism, having achieved its religious evolution, became a political party. Weary of being trodden under foot, it now demanded much more radical reform, quitting the ranks of peaceable citizens to pass into the only militant class of the time and adopt its customs. Men like Coligny, d'Andelot and Condé took the place of the timid Lefèvre of Étapes and the harsh and bitter Calvin; and the reform party, in contradiction to its doctrines and its doctors, became a political and religious party of opposition, with all the compromises that presupposes. The struggle against it was no longer maintained by the university and the parlement alone, but also by the king, whose authority it menaced.

With his intrepid spirit, his disdain for ecclesiastical authority and his strongly personal religious feeling, Francis I. had for a moment seemed ready to be a reformer himself; but deprived by the Concordat of all interest in the worship of church property, aspire to political alliance with the pope, and as mistrustful of popular forces as desirous of absolute power and devoted to Italy, he paused and then drew back. Hence came the revocation in 1540 of the edict of tolerance of Coucy (1539), and the massacre of the Vaudois (1545). Henry II., a fanatic, went still further in his edict of Châteaubriant (1551), a code of veritable persecution, and in the coup d'état carried out in the parlement against Antoine du Bourg and his colleagues (1559). At the same time the pastors of the reformed religion,
yet in synod at Paris, were setting down their confession of faith founded upon the Scriptures, and their ecclesiastical discipline founded upon the independence of the church. Thenceforward Protestantism adopted a new attitude, and refused obedience to the orders of a persecuting monarch when contrary to its faith and its interests. After the saints came men. Hence those wars of religion which were to hold the monarchy in check for forty years and even force it to come to terms.

In slaying Henry II. Montgomery's lance saved the Protestants for the time being. His son and successor, Francis II., was but a nervous sickly boy, handicapped between two women: his mother, Catherine de' Medici, hitherto kept in the background, and his wife, Mary Stuart, queen of Scotland, who being a niece of the Guises brought her uncles, the constable Francis and the cardinal of Lorraine, into power. These ambitious and violent men took the government out of the hands of the constable de Montmorency and the princes of the blood: Antoine de Bourbon, king of Navarre, weak, credulous, always playing a double game on account of his preoccupation with Navarre; Condé, light-hearted and brave, but not fitted to direct a party; and the cardinal de Bourbon, a mere nonentity. The only plan which these princes could adopt in the struggle, once they had lost the king, was to make a following for themselves among the Calvinist malcontents and the gentlewomen disbanding after the Italian war. The Guises, strengthened by the failure of the conspiracy of Amboise, which had been aimed at them, abused the advantage due to their victory. Despite the edict of Romorantin, which by giving the bishops the right of cognizance of heresy prevented the introduction of the Inquisition on the Spanish model into France; despite the assembly of Fontainebleau, where an attempt was made at a compromise acceptable to both Catholics and moderate Calvinists; the reform party and its Bourbon leaders, arrested at the states-general of Orleans, were in danger of their lives. The death of Francis II. in December 1560 compromised the influence of the Guises and again saved Protestantism.

Charles IX. also was a minor, and the regent should legally have been the first prince of the blood, Antoine de Bourbon; but cleverly flattered by the queen-mother, Catherine de' Medici, he let her take the reins of government. Hitherto Catherine had been merely the resigned and neglected wife of Henry II., and though eloquent, insinuating and ambitious, she had been inactive. She had attained the age of forty-one when she at last came into her own amidst the corpses and amputations, the fall of the Guises and the return of the Bourbons to fortune. Indifferent in religious matters, she had a passion for authority, a characteristically Italian adroitness in intrigue, a fine political sense, and the feeling that the royal authority might be endangered both by Calvinistic passions and Catholic violence. She decided for a system of tolerance; and Michel de l'Hôpital, the new chancellor, was her spokesman at the states of Orleans (1560).

He was a good and honest man, moderate, conciliatory and temporizing, anxious to lift the monarchy above the strife of parties and to reconcile them; but he was so little practical that he could believe in a reformation of the laws in the midst of all the violent passions which were now to be let loose. These two, Catherine and her chancellor, attempted, like Charles V. at Augsburg, to bring about religious pacification as a necessary condition for the maintenance of order; but they were soon overcome by the different factions.

On one side was the Catholic triumvirate of the constable de Montmorency, the duke of Guise, and the marshal de St. André; and on the other the Huguenot party of Coligny and Condé, who, having obtained liberty of conscience in January 1561, now demanded liberty of worship. The colloquy at Poissy between the cardinal of Lorraine and Theodore Beza (September 1561), did not end in the agreement hoped for, and the duke of Guise so far abused his spirit as to embroil the French Calvinists with the German Lutherans. The rupture seemed irreparable when the assembly of Poissy recognized the order of the Jesuits, which the French crown had held in suspicion since its foundation. But, however, yielding to the current which was carrying the greater part of the nation towards reform, and despite the threats of Philip II., who dreaded Calvinistic propaganda in his Netherlands, Michel de l'Hôpital promulgated the edict of January 15, 1562—a true charter of enfranchisement for the Protestants. But the pressure of events and of parties was too strong; the policy of toleration which had miscarried at the council of Trent had no chance of success in France.

The triumvirate's relations with Spain and Rome were very close; they had complete ascendancy over the king and over Catherine; and now the massacre of two hundred Protestants at Vassy on the 1st of March 1562 made the cup overfull. The duke of Guise had either ordered this, or allowed it to take place, on his return from an interview with the duke of Württemberg at Zabern, where he had once more demanded the help of his Lutheran neighbours against the Calvinists; and the Catholics having celebrated this as a victory the signal was given for the commencement of religious wars. When these eight fratricidal wars first began, Protestants and Catholics rivalled one another in respect for royal authority; only they wished to become its masters so as to get the upper hand themselves. But in course of time, as the struggle became embittered, Catholicism itself grew revolutionary; and this twofold fanaticism, Catholic and Protestant, even more than the ambition of the leaders, made the war a ferocious one from the very first. Beginning with surprise attacks, if these failed, the struggle was continued by means of sieges and by terrible exploits like those of the Catholic Montluc and the Protestant des Adrets in the south of France.

Neither of these two parties was strong enough to crush the other, owing to the apathy and continual desertions of the gentlemen-cavaliers who formed the élite of the Protestant army and the insufficient numbers of the Catholic forces. Allies from outside were therefore called in, and this it was that gave a European character to these wars of religion; the two parties were parties of foreigners, the Protestants being supported by German Landsknechts and Elizabeth of England's cavalry, and the royal army by Italian, Swiss or Spanish auxiliaries. It was no longer patriotism but religion that distinguished the two camps. There were three principal theatres of war: in the north Normandy and the valley of the Loire, where Orleans, the general centre of reform, ensured communications between the north and Germany; in the south-west Gascony and Guienne; in the south-east Lyonnais and Vivarais.

In the first war, which lasted for a year (1562-1563), the triumvirate wished to secure Orleans, previously isolated. The threat of an English landing decided them to lay siege to Rouen, and it was taken by assault; but this cost the life of the versatile Antoine de Bourbon. On the 10th of December 1562 the duke of Guise barred the way to Dreux against the German reinforcements of d'Andelot, who after having threatened Paris were marching to join forces with the English troops for whom Coligny and Condé had paid by the cession of Havre. The death of marshal de St. André, and the capture of the constable de Montmorency and of Condé, which marked this indecisive battle, left Coligny and Guise face to face. The latter's success was of brief duration; for on the 18th of February 1563 Poltrot de Mére assassinated him before Orleans, which he was trying to take once and for all. Catherine, relieved by the loss of an inconvenient preceptor, and by the disappearance of the other leaders, became mistress of the Catholic party, of whose strength and popularity she had now had proof, and her idea was to make peace at once on the best terms possible. The egoism of Condé, who got himself made lieutenant-general of the kingdom, and bargained for freedom of worship for the Protestant nobility only, compromised the future of both his church and his party, though rendering possible the peace of Amboise, concluded the 10th of March.
1563. All now set off together to recapture Havre from the English.

The peace, however, satisfied no one; neither Catholics (because of the rupture of religious unity) nor the parlementists; the pope, the emperor and king of Spain alike protested against it. Nor yet did it satisfy the Protestants, who considered its concessions insufficient, above all for the people. It was, however, the maximum of tolerance possible just then, and had to be reverted to; Catherine and Charles IX. soon saw that the times were not ripe for a third party, and that to enforce real toleration would require an absolute power which they did not possess. After three years the Guises reopened hostilities against Coligny, whom they accused of having plotted the murder of their chief; while the Catholics, egged on by the Spaniards, rose against the Protestants, who had been made uneasy by an interview between Catherine and her daughter Elizabeth, wife of Philip II. of Spain, at Bayonne, and by the duke of Alva's persecutions of the reformed church of the Netherlands—a daughter-church of Geneva, like their own. The second civil war began like the first with a frustrated attempt to kidnap the king at the castle of Montceaux, near Meaux, in September 1567; and with a siege of Paris, the capital of Catholicism, in the course of which the constable of Montmorency was killed at Saint-Denis. Condé, with the men-at-arms of John Casimir, son of the Count Palatine, tried to starve out the capital; but once more the defection of the nobles obliged him to sign a treaty of peace at Longjumeau on the 23rd of March 1568, by which the conditions of Amboise were re-established. After the attempt at Montceaux the Protestants had to be contented with Charles IX.'s word.

This peace was not of long duration. The fall of Michel de l'Hôpital, who had so often guaranteed the loyalty of the Huguenots, ruined the moderate party (May 1568). Catholic propaganda, revived by the monks and the Jesuits, and backed by the armed confederacies and by Catherine's favourite son, the duke of Anjou, now entrusted with a prominent part by the cardinal of Lorraine; Catherine's complicity in the duke of Alva's terrible persecution in the Netherlands; and her attempt to capture Coligny and Condé at Noyers all combined to cause a fresh outbreak of hostilities in the west. Thanks to Tavannes, the duke of Anjou gained easy victories at Jarnac over the prince of Condé, who was killed, and at Moncontour over Coligny, who was wounded (March–October 1569); but these successes were rendered fruitless by the jealousy of Charles IX. Allowing the queen of Navarre to shut herself up in La Rochelle, the citadel of the reformers, and the king to loiter over the siege of Saint Jean d'Angély, Coligny pushed boldly forward towards Paris and, having reached Burgundy, defeated the royal army at Aray-le-Duc. Catherine had exhausted all her resources; and having failed in her project of remarrying Philip II. to one of her daughters, and of betrothing Charles IX. to the eldest of the Austrian archduchesses, exasperated also by the presumption of the Lorraine family, who aspired to the marriage of their nephew with Charles IX.'s sister, she signed the peace of St Germain on the 8th of August 1570. This was the culminating point of Protestant liberty; for Coligny exacted and obtained, first, liberty of conscience and of worship, and then, as a guarantee of the king's word, four fortified places: La Rochelle, a key to the sea; La Charité, in the centre; Cognac and Montauban in the south.

The Guises set aside, Coligny, supported as he was by Jeanne d'Albret, queen of Navarre, now received all Charles IX.'s favours. Catherine de' Medici, an inveterate matchmaker, and also uneasy at Philip II.'s increasing power, made advances to Jeanne, proposing to marry her own daughter, Marguerite de Valois, to Jeanne's son, Henry of Navarre, now chief of the Huguenot party. Coligny was a Protestant, but he was a Frenchman before all; and wishing to reconcile all parties in a national struggle, he "trumpeted war" (cornait la guerre) against Spain in the Netherlands—despite the lukewarmness of Elizabeth of England and the Germans, and despite the counter-intrigues of the pope and of Venice. He succeeded in getting French troops sent to the Netherlands, but they suffered defeat. None the less Charles IX. still seemed to see only through the eyes of Coligny; till Catherine, fearing to be supplanted by the latter, dared the results of the threatened war with Spain, and egged on by a crowd of Italian adventurers in the pay of Spain—men like Gondi and Birague, reared like herself in the political theories and customs of their native land—saw no hope but in the assassination of this rival in her son's esteem. A murderous attack upon Coligny, who had opposed the candidature of Catherine's favourite son, the duke of Anjou, for the throne of Poland, having only succeeded in wounding him and in exciting the Calvinist leaders, who were congregated in Paris for the occasion of Marguerite de Valois's marriage with the king of Navarre, Catherine and the Guises resolved together to put them all to death. There followed the wholesale massacre of St Bartholomew's Eve, in Paris and in the provinces; a natural consequence of public and private hatreds which had poisoned the entire social organism. This massacre had the effect of preventing the expedition into Flanders, and destroying Francis I.'s policy of alliance with the Protestants against the house of Austria.

Catherine de' Medici soon perceived that the massacre of St Bartholomew had settled nothing. It had, it is true, dealt a blow to Calvinism just when, owing to the reforms of the council of Trent, the religious ground had been crumbling beneath it. Moreover, within the party itself a gulf had been widening between the pastors, supported by the Protestant democracy and the political nobles. The reformers had now no leaders, and their situation seemed as perilous as that of their co-religionists in the Netherlands; while the sieges of La Rochelle and Leiden, the enforced exile of the prince of Orange, and the conversion under pain of death of Henry of Navarre and the prince of Condé, made the common danger more obvious. Salvation came from the very excess of these measures. A third party was once more formed, composed of moderates from the two camps, and it was recruited quite as much by jealousy of the Guises and by ambition as by horror at the massacres. There were the friends of the Montmorency party—Damville at their head; Coligny's relations; the king of Navarre; Condé; and a prince of the blood, Catherine de' Medici's third son, the duke of Alençon, tired of being kept in the background. This party took shape at the end of the fourth war, followed by the edict of Boulogne (1573), forced from Charles IX. when the Catholics were deprived of their leader by the election of his brother, the duke of Anjou, as king of Poland. A year later the latter succeeded his brother on the throne of France as Henry III. This meant a new lease of power for the queen-mother.

The *politics*, as the supporters of religious tolerance and an energetic repression of faction were called, offered their alliance to the Huguenots, but these, having formed themselves, by means of the Protestant Union, into a sort of republic within the kingdom, hesitated to accept. It is, however, easy to bring about an understanding between people in whom religious fury has been extinguished either by patriotism or by ambition, like that of the duke of Alençon, who had now escaped from the Louvre where he had been confined on account of his intrigues. The compact was concluded at Millau; Condé becoming a Protestant once more in order to treat with Damville, Montmorency's brother. Henry of Navarre escaped from Paris. The new king, Henry III., vacillating and vicious, and Catherine herself, eager for war as she was, had no means of separating the Protestants and the *politics*. Despite the victory of Guise at Dormans, the agreement between the duke of Alençon and John Casimir's German army obliged the royal party to grant all that the allied forces demanded of them.

**Henry III.**

(1574–1589).
in the “peace of Monsieur,” signed at Beaulieu on the 6th of May 1576, the duke of Anjou receiving the appanage of Anjou, Touraine and Berry, the king of Navarre Guienne, and Conde Picardy, while the Protestants were granted freedom of worship in all parts of the kingdom except Paris, the rehabilitation of Coligny and the other victims of St Bartholomew, their fortified towns, and an equal number of seats in the courts of the parlements.

This was going too fast; and in consequence of a reaction against this too liberal edict a fourth party made its appearance, that of the Catholic League, under the Guises—Henri de Balâtre, duke of Guise, and his two brothers, Charles, duke of Mayenne, and Louis, archbishop of Reims and cardinal. With the object of destroying Calvinism by effective opposition, they imitated the Protestant organization of provincial associations, drawing their chief supporters from the upper middle class and the lesser nobility. It was not at first a demagogy maddened by the preaching of the irreconcilable clergy of Paris, but a union of the more honest and prudent classes of the nation in order to combat heresy. Despite the immorality and impotence of Henry III. and the Protestantism of Henry of Navarre, this party talked of re-establishing the authority of the king; but in reality it inclined more to the Guises, martyrs in the good cause, who were supported by Philip II. of Spain and Pope Gregory XIII. A sort of popular government was thus established to counteract the incapacity of royalty, and it was in the name of the imperilled rights of the people that, from the States of Blois onward, this Holy League demanded the re-establishment of Catholic unity, and set the religious right of the nation in opposition to the divine right of incapable or evil-doing kings (1576).

In order to oust his rival Henry of Guise, Henry III. made a desperate effort to outbid him in the eyes of the more extreme Catholics, and by declaring himself head of the League degraded himself into a party leader. The League, furious at this stroke of policy, tried to impose a council of thirty-six advisers upon the king. But the deputies of the third estate did not support the other two orders, and the latter in their turn refused the king money for making war on the heretics, desiring, they said, not war but the destruction of heresy. This would have reduced Henry III. to impotence; fortunately for him, however, the break of the Huguenots with the “Malcontents,” and the divisions in the court of Navarre and in the various parties at La Rochelle, allowed Henry III., after two little wars in the south west, during which fighting gradually degenerated into brigandage, to sign terms of peace at Bergerac (1577), which much diminished the concessions made in the edict of Beaulieu. This peace was confirmed three years after by that of Fleix. The suppression of both the leagues was stipulated for (1580). It remained, however, a question whether the Holy League would submit to this.

The death of the duke of Anjou after his mad endeavour to establish himself in the Netherlands (1584), and the accession of Henry of Navarre, heir to the effeminat Henry III., reversed the situations of the two parties: the Protestants again became supporters of the principle of heredity and divine right; the Catholics appealed to right of election and the sovereignty of the people. Could the crown of the eldest daughter of the Church be allowed to devolve upon a relapsed heretic? Such was the doctrine officially preached in pulpits and pamphlets. But between Philip II.—so-called despotic and despightful, from William of Orange, involved in strife with the English Protestants, and desirous of avenging the injuries inflicted upon him by the Valois in the Netherlands—and the Guises on the other hand, whose cousin Mary Stuart was a prisoner of Queen Elizabeth, there was a common interest in supporting one another and pressing things forward. A definite agreement was made between them at Joinville (December 31, 1584), the religious and popular pretext being the danger of leaving the kingdom to the king of Navarre, and the ostensible end to secure the succession to a Catholic prince, the old Cardinal de Bourbon, an ambitious and violent man of mean intelligence; while the secret aim was to secure the crown for the Guises, who had already attempted to fabricate for themselves a genealogy tracing their descent from Charlemagne. In the meantime Philip II., being rid of Don John of Austria, whose ambition he dreaded, was to crush the Protestants of England and the Netherlands; and the double result of the compact at Joinville was to allow French politics to be controlled by Spain, and to transform the wars of religion into a purely political quarrel.

The pretensions of the Guises were, in fact, soon manifested in the declaration of Pérone (March 30, 1583) against the foul court of the Valois; they were again manifested in a furious agitation, fomented by the secret council of the League at Paris, which favoured the Guises, and which now worked upon the people through their terror of Protestant retaliations and the Church’s peril.

Incited by Philip II., who wished to see him earning his pension of 600,000 golden crowns, Henry of Guise began the war in the end of April, and in a few days the whole kingdom was on fire. The situation was awkward for Henry III., who had not the courage to ask Queen Elizabeth for the soldiers and money that he lacked. The crafty king of Navarre being unwilling to alienate the Protestants save by an apostasy profitable to himself, Henry III., by the treaty of Nemours (July 7, 1585), granted everything to the head of the League in order to save his crown. By a stroke of the pen he suppressed Protestantism, while Pope Sixtus V., who had at first been unfavourable to the treaty of Joinville as a purely political act, though he eventually yielded to the solicitations of the League, excommunicated the two Bourbons, Henry and Condé. But the duke of Guise’s audacity did not make Henry III. forget his desire for vengeance. He hoped to realize it by attaching him to his cause. His favourite Joyeuse was to defeat the king of Navarre, whose forces were very weak, while Guise was to deal with the strong reinforcement of Germans that Elizabeth was sending to Henry of Navarre. Exactly the contrary happened. By the defeat of Joyeuse at Coutras Henry III. found himself wounded on his strongest side; and by Henry of Guise’s successes at Vimory and Auneau the Germans, who should have been his best auxiliaries against the League, were crushed (October-November 1587).

The League now thought they had no longer anything to fear. Despite the king’s hostility the duke of Guise came to Paris, urged thereto by Philip II., who wanted to occupy Paris and be master of the Channel coasts whilst he launched his invincible Armada to avenge the death of Mary Stuart in 1587. On the Day of the Barricades (May 12, 1588) Henry III. was besieged in the Louvre by the populace in revolt; but his rival dared not go so far as to depose the king, and appeased the tumult. The king, having succeeded in taking refuge at Chartres, ended, however, by granting him in the Act of Union all that he had refused in face of the barricades—the post of lieutenant-general of the kingdom and the proscription of Protestantism. At the second assembly of the states of Blois, called together on account of the need for money (1588), all of Henry III.’s enemies who were elected showed themselves even bolder than in 1576 in claiming the control of the financial administration of the kingdom; but the destruction of the Armada gave Henry III., already exasperated by the insults he had received, new vigour. He had the old Cardinal de Bourbon imprisoned, and Henry of Guise and his brother the Cardinal assassinated (December 23, 1588). On the 6th of January, 1589, died his mother, Catherine de’Medici, the astute Florentine.

“Now I am king!” cried Henry III. But Paris being dominated by the duke of Mayenne, who had escaped assassination, and by the council of “Sixteen,” the chiefs of the League, most of the provinces replied by open revolt, and Henry III.
FRANCE

HISTORY

The coronation of the king at Chartres in February 1594 completed the rout of the League. The parlement of Paris declared against Mayenne, who was simply the mouth-

piece of Spain, and Brissac, the governor, surrendered the capital to the king. The example of Paris and Henry IV.'s clemency rallied round him all prudent Catholics, like Villeroi and Jeaninn, anxious for national unity; but he had to buy over the adherents of the League, who sold his own kingdom for sixty million francs. The pontifical absolution of September 17, 1595, finally stultified the League, which had been again betrayed by the unsuccessful plot of Jean Chastel, the Jesuit's pupil.

Nothing was now left but to expel the Spaniards, who under cover of religion had worked for their own interests alone. Despite the brilliant charge of Fontaine-Française in Burgundy (June 5, 1595), and the submission of the heads of the League, Guise, Mayenne, Joyeuse, and Mercœur, the years 1595-1597 were not fortunate for Henry IV.'s armies. Indignant at his conversion, Elizabeth, the Germans, and the Swiss Protestants deserted him; while the taking of Amiens by the Spaniards compromised for the moment the future both of the king and the country. But exhaustion of each other, by which only England and Holland profited, brought about the Peace of Vervins. This confirmed the results of the treaty of Cateau-Cambriésis (May 2, 1598), that is to say, the decadence of Spanish power, and its inability either to conquer or to dismember France.

The League, having now no reason for existence, was dissolved; but the Protestant party remained very strong, with its political organization and the fortified places which the assemblies of Millau, Nîmes, and La Rochelle (1573-1574) had established in the south and the west. It was a republican state within the kingdom, and, being unwilling to break with it, Henry IV. came to terms by the edict of Nantes, on the 13th of April 1598. This was a compromise between the royal government and the Huguenot government, the latter giving up the question of the national worship, which was only authorized where it had existed before 1597 and in two towns of each bailliage, with the exception of Paris; but it secured liberty of conscience throughout the kingdom, state payment for its ministers, admission to all employments, and courts composed equally of Catholics and Protestants in the parlements. An authorization to hold synods and political assemblies, to open schools, and to occupy a hundred strong places for eight years at the expense of the king, assured to the Protestants not only rights but privileges. In no other country did they enjoy so many guarantees against a return of persecution. This explains why the edict of Nantes was not registered without some difficulty.

Thus the blood-stained 16th century closed with a promise of religious toleration and a dream of international arbitration. This was the end of the long tragedy of civil strife, of wars and of wars mingled with the sound of madrigals and psalms and pavans. It had been the golden age of the arquebus and the viol, of sculptors and musicians, of poets and humanists, of fratricidal conflicts and of love-songs, of mignons and martyrs. At the close of this troubled century peace descends upon exhausted passions; and amidst the choir of young and ardent voices celebrating the national reconciliation, the tocsin no longer sounds its sinister and persistent bass. Despite the leagues of either faith, religious liberty was now confirmed by the more free and generous spirit of Henry IV.

Why was this king at once so easygoing and so capricious? Why, again, had the effort and authori-ty of feudal and popular resistance been squandered in the futilities of the League and to further the ambitions of the rebellious Guises? Why had the monarchy been forced to purchase the obedience of the upper classes and the provinces with immodities which enfeebled it without limiting it? At all events, when the kingdom had been reconquered from the Spaniards and religious strife ended, in order to fulfil his engagements, Henry IV. need only have
associated the nation with himself in the work of reconstructing the shattered monarchy. But during the atrocious holocausts formidable of the Hundred Years' War, the lack of political feeling on the part of the upper classes and their selfishness, led to a fresh abdication of the nation's rights. The need of living caused the neglect of that necessity for control which had been maintained by the states-general from 1560 to 1593. And this time, moderation on the part of the monarchy no longer made for success. Of the two contrary currents which have continually mingled and conflicted throughout the course of French history, that of monarchical absolutism and that of aristocratic and democratic liberty, the former was now to carry all before it.

The kingdom was now issuing from thirty-eight years of civil war. Its inhabitants had grown unaccustomed to work; its finances were ruined by dishonesty, disorder, and a very heavy foreign debt. The most characteristic symptom of this distress was the brigandage carried on incessantly from 1550 to 1610. Side by side with this temporary disorder there was a more serious administrative disorganization, a habit of no longer obeying the king. The harassed population, the municipalities which under cover of civil war had resumed the right of self-government, and the parlements elated with their social importance and their security of position, were not alone in abandoning duty and obedience. Two powers faced each other threateningly: the organized and malcontent Protestants; and the provincial governors, all great personages possessing an armed following, theoretically agents of the king, but practically independent. The Montmorency's, the D'Epernon's, the Biron's, the Guise's, were accustomed to consider their offices as hereditary property. Not that these two powers entered into open revolt against the king; but they had adopted the custom of recriminating, of threatening, of coming to understandings with the foreign powers, which with some of them, like Marshal Biron, the D'Entreagues and the duc de Bouillon, amounted to conspiracy (1602-1606).

As to the qualifications of the king: he had had the good fortune not to be educated for the throne. Without much learning and sceptical in religious matters, he had the lively intelligence of the Gascon, more subtle than profound, more brilliant than steady. Married to a woman of loose morals, and afterwards to a devout Italian, he was gross and vulgar in his appetites and pleasures. He had retained all the habits of a country gentleman of his native Bearn, careless, familiar, boastful, thrifty, cunning, combined since his sojourn at the court of the Valois with a taint of corruption. He worked little but rapidly, with none of the bureaucratic pedantry of a Philip II. cloistered in the dark towers of the Escorial. Essentially a man of action and a soldier, he preserved his tone of command after he had reached the throne, the inflexibility of the military chief, the conviction of his absolute right to be master. Power quickly intoxicated him, and his monarchy was therefore anything but parliamentary. His personality was everything, institutions nothing. If, at the same time, he retained the mannerisms of a Burgundian, in 1596, Henry IV. spoke of putting himself in tutelage, that was but preliminary to a demand for money. The states-general, called together ten times in the 16th century, and at the death of Henry III. under promise of convocation, were never assembled. To put his absolute right beyond all control he basé it upon religion, and to this sceptic obedience became a heresy. He tried to make the clergy into an instrument of government by recalling the Jews, who had been driven away in 1594, partly from fear of their regicides, partly because they have always been the best teachers of servitude; and he gave the youth of the nation into the hands of this cosmopolitan and ultramontane clerical order. His government was personal, not through departments; he retained the old council though reducing its members; and his ministers, taken from every party, were never—not even Sully—anything more than mere clerks, without independent position, mere instruments of his good pleasure. Fortunately this was not always capricious.

Henry IV. soon realized that his most urgent duty was to resuscitate the corpse of France. Pilfering was suppressed, and the revolts of the malcontents—the Gauthiers of Normandy, the Croquants and Tard-avisot of Périgord and Limousin—were quelled, adroitly at first, and later with a sterner hand. He then provided for the security of the country districts, and reduced the taxes on the peasants, the most efficacious means of making them productive and able to pay. Inspired by Barthélemy de Laffémites (1545-1612), controller-general of commerce, and by Olivier de Serres (1539-1610),1 Henry IV. encouraged the culture of silk, though without much result, had orchards planted and marshes drained; while though he permitted the free circulation of wine and corn, this depended on the harvests. But the twofold effect of civil war—the ruin of the farmers and the scarcity and high price of rural labour—was only reduced arbitrarily and by fits and starts.

Despite the influence of Sully, a convinced agrarian because of his horror of luxury and love of economy, Henry IV. likewise attempted amelioration in the towns, where the state of affairs was even worse than in the country. But the edict of 1597, far from inaugurating individual liberty, was but a fresh edition of that of 1581, a second preface to the legislation of Colbert, and in other ways no better respected than the first. As for the new features, the syndical courts proposed by Laffémites, they were not even put into practice. Various industries, nevertheless, concurrent with those of England, Spain and Italy, were created or reorganized: silk-weaving, printing, tapestry, &c. Sully at least provided resplendent manufacture with the roads necessary for communication, and planted them with trees. In external commerce Laffémites and Henry IV. were equally the precursors of Colbert, freeing raw material and prohibiting the import of products similar to those manufactured within the kingdom. Without regaining that preponderance in the Levant which had been seen after the victory of Lepanto and before the civil wars, Marseilles still took an honourable place there, confirmed by the renewal in 1604 of the capitulations of Francis I. with the sultan. Finally, the system of commercial companies, anti-patrician to the French bourgeoisie, was for the first time practised on a grand scale; but Sully never understood that movement of colonial expansion, begun by Henry II. in Brazil and continued in Canada by Champlain, which had so marvellously enlarged the European horizon. His point of view was altogether more limited than that of Henry IV.; and he did not foresee, like Elizabeth, that the future would belong to the peoples whose national energy took that line of action.

His sphere was essentially the superintendence of finance, to which he brought the same enthusiasm that he had shown in fighting the League. Vain and imaginative, his reputation was enormously enhanced by his 1 Economies royales; he was no innovator, and being a true representative of the nation at that period, like it was but lukewarm towards reform, accepting it always against the grain. He was not a financier of genius; but he administered the public moneys with the same probity and exactitude which he used in managing his own, retrieving alienated property, straightening accounts, balancing expenditure and receipts, and amassing a reserve in the Bastille. He did not reform the system of aides and tailles established by Louis XI. in 1422; but by charging much upon indirect taxation, and slightly lessening the burden of direct taxation, he avoided an appeal to the states-general and gave an illusion of relief.

Nevertheless, economic disasters, political circumstances and the personal government of Henry IV. (precursor in this also

1 Olivier de Serres, sieur de Pradel, spent most of his life on his model farm at Pradel. In 1599 he dedicated a pamphlet on the cultivation of silk to Henry IV., and in 1600 published his Théâtre d’agriculture et ménage des champs, which passed through nineteen editions up to 1675.
of Louis XIV.) rendered his task impossible or fatal. The nobility remained in debt and disaffected; and the clergy, more remarkable for wealth and breeding than for virtues, were won over to the ultramontane ideas of the triumphant Jesuits. The rich bourgeoisie began more and more to monopolize the magistracy; and though the country-people were somewhat relieved from the burden which had been crushing them, the working-classes remained impoverished, owing to the increase of prices which followed at a distance the rise of wages. Moreover, under insinuating and crafty pretenses, Henry IV. undermined as far as he could the right of control by the states-general, the right of remonstrance by the parlements, and the communal franchises, while ensuring the impoverishment of the municipalities by his fiscal methods. Arbitrary taxation, scandalous intervention in elections, forced candictates, confusion in their financial administration, bankruptcy and revolt on the part of the tenants: all formed an anticipation of the personal rule of Richelieu and Louis XIV.

Thus Henry IV. evinced very great activity in restoring order and very great poverty of invention in his methods. His sole original creation, the edict of La Paulette in 1604, was an attempt to confer the benefits of one-sixtieth of the salary on the various persons of the kingdom and on the magistrates on the basis of an annual payment of a mere fraction of his salary. The idea was the projected war against Spain, which Henry IV. was about to embark when he was assassinated. The "grand design" of Sully, the organization of a "Christian Republic" of the European nations for the preservation of peace, was but the invention of an irresponsible minister, soured by defeat and wishing to impress posterity. Henry IV., the least visionary of kings, was between 1598 and 1610 really hesitating between two great contradictory political schemes: the war clamored for by the Protestants, politicians like Sully, and the nobility; and the Spanish alliance, to be cemented by marriages, and preached by the ultramontane Spanish camarilla formed by the queen, Père Coton, the king's confessor, the minister Villeroi, and Ubaldini, the papal nuncio. Selfish and suspicious, Henry IV. consistently played this double game of policy in conjunction with president Jeannin. By his alliance with the Grisons (1603) he guaranteed the integrity of the Valtellina, the natural approach to Lombardy for the imperial forces; and by his intimate union with Geneva he controlled the routes by which the Spaniards could reach their hereditary possessions in France. Comté and the Low Countries from Italy. But he had defeated the design of Savoy he had no hesitation in making sure of him by a marriage; though the Swiss might have misunderstood the treaty of Brusel (1610) by which he gave one of his daughters to the grandson of Philip II. On the other hand he astonished the Protestant world by the imprudence of his mediation between Spain and the rebellious United Provinces (1605). When the succession of Cleves and of Jülich, so long expected and already discounted by the treaty of Halle (1610), was opened up in Germany, the great war was largely due to an access of senile passion for the charms of the princesse de Condé. The stroke of Ravaillac's knife caused a timely descent upon the curtain upon this new and tragi-comic Trojan War. Thus, here as elsewhere, we see a vacillating hand-to-mouth policy, at the mercy of a passing for power or for sensational gratification. The Cornette blanche of Arques, the Poule au.phi of the peasant, successes as a lover and a dashing spirit, have combined to surround Henry IV. with a halo of romance not justified by fact.

The extreme instability of monarchical government showed itself afresh after Henry IV.'s death. The reign of Louis XIII., a perpetual regency by women, priests, and favourites, was indeed a curious prelude to the grand age of the French monarchy. The eldest son of Henry IV. being a minor, Marie de' Medici induced the parlement to invest her with the regency, thanks to Villeroi and contrary to the last will of Henry IV. This second Florentine, at once jealous of power and incapable of exercising it, bore little resemblance to her predecessor. Light-minded, haughty, apathetic and cold-hearted, she took a sort of passionate delight in changing Henry IV.'s whole system of government. Who would support her in this? On one side were the former ministers, Sillery and president Jeannin, ex-leaguers but loyalists, no lovers of Sicilian or Fiesolene revolutions; the other side the princes of the blood and the great nobles, Condé, Guise, Mayence, the other dukes, apparently still much more faithful to French ideas, but in reality convinced that the days of kings were over and that their own had arrived. Instead of weakening this aristocratic agitation by the see-saw policy of Catherine de' Medici, Marie could invent no other device than to despoil the royal treasure by distributing places and money to the chiefs of both parties. The savings all expended and Sully fallen into disgrace, she lost her influence and became the almost unconscious instrument of an ambitious man of low birth, the Florentine Concini, who was to drag her down with him in his fall; petty shifts became henceforward the order of the day.

Thus Villeroi thought fit to add still further to the price already paid to triumph Madrid and Vienna by disbanding the army, breaking the treaty of Brusel, and abandoning the Protestant princes beyond the Rhine and the trans-Pyrenean Moriscos. France joined hands with Spain in the marriages of Louis XIII. with Anne of Austria and Princess Elizabeth with the son of Philip III. The Spanish ambassadors had the plenary power, the whole council of the queen. To soothe the irritation of England the duke de Bouillon was sent to London to offer the hand of the king's sister to the prince of Wales. Meanwhile, however, still more was ceded to the princes than to the kings; and after a pretence of drawing the sword against the prince of Condé, rebellious through jealousy of the Italian surroundings of the queen-mother, recourse was had to the purse. The peace of Sainte Menehould, four years after the death of Henry IV., was a virtual abdication of the monarchy (May 1614); it was time for a move in the other direction. Villeroi inspired the regent with the idea of an armed expedition, accompanied by the little king, into the West. The convocation of the states-general was about to take place, wrung, as in all minorities, from the royal weakness—this time by Condé; so the elections were influenced in the monarchist interest. The king's majority, solemnly proclaimed on the 28th of October 1614, further strengthened the throne; while owing to the bungling of the third estate, who did not contrive to gain the support of the clergy and the nobility by some sort of compromise, the estates-general of last March 1615, passed like the others a mere historic episode, an impotent and useless expedient. In vain Condé tried to play with the parlement of Paris the same game as with the states-general, in a sort of anticipation of the Fronde. Villeroi demurred; and the parlement, having illegally assumed a political rôle, broke with Condé and effected a reconciliation with the court. After this double victory Marie de' Medici could at last undertake the famous journey to Bordeaux and consummate the Spanish marriages. In order not to countenance by his presence an act which had been the pretext for his opposition, Condé rebelled
once more in August 1615; but he was again pacified by the governorships and pensions of the peace of Loudon (May 1616).

But Villeroy and the other ministers knew not how to reap the full advantage of their victory. They had but one desire, to put themselves on a good footing again with Condé, instead of applying themselves honestly to the service of the king. The "marshals," Concini and his wife Leonora Galigai, more influential with the queen and more exacting than ever, by dint of clever intrigues forced the ministers to retire one after another; and with the last of Henry IV.'s "greybeards" vanished also all the pecuniary reserves left. Concini surrounded himself with new men, insignificant persons ready to do his bidding, such as Barbin or Mangot, while in the background was Richelieu, bishop of Luçon. Condé now began intrigues with the princes whom he had previously betrayed; but his pride dissolved in piteous entreaties when Thèmines, captain of the guard, arrested him in September 1616. Six months later Concini had not even time to protest when another captain, Vitry, slew him at the Louvre, under orders from Louis XIII., on the 24th of April 1617.

Richelieu had appeared behind Marie de' Medici; Albert de Luynes rose behind Louis XIII., the neglected child whom he had contrived to amuse. "The tavern remained the same, having changed nothing but the bush." De Luynes was made a duke and marshal. Concini's place, with no better title, the duc d'Épernon, supported by the queen-mother (now in disgrace at Blois), took Condé's place at the head of the opposition. The treaties of Angoulême and Angers (1619-1620), negotiated by Richelieu, recalled the "unwholesome" treaties of Sainte-Menehould and Loudon. The revolt of the Protestants was more serious. Goaded by the vigorous revival of militant Catholicism which marked the opening of the 17th century, de Luynes tried to put a finishing touch to the triumph of Catholicism in France, which he had assisted, by abandoning in the treaty of Ulm the defence of the small German states against the ambition of the ruling house of Austria, and by sacrificing the Protestant Grisons to Spain. The re-establishment of Catholic worship in Béarn was the pretext for a rising among the Protestants, who had remained loyal during these troublous years; and although the military organization of French Protestantism, arranged by the assembly of La Rochelle, had been checked in 1621, by the defection of most of the reformed nobles, like Bouillon and Lescudières, de Luynes had to raise the disastrous siege of Montauban. Death alone saved him from the disgrace suffered by his predecessors (December 1615).

From 1621 to 1624 Marie de' Medici, re-established in credit, prosecuted her intrigues; and in three years there were three different ministries: de Luynes was succeeded by the prince de Condé, whose Montauban was found at Montpellier; the Brûlarts succeeded Condé, and having, like de Luynes, neglected France's foreign interests, they had to give place to La Vieuville; while this latter was arrested in his turn for having sacrificed the interests of the English Catholics in the negotiations regarding the marriage of Henrietta of France with the prince of Wales. All these personages were undistinguished figures beyond whom might be discerned the cold clear-cut profile of Marie de' Medici's secretary, now a cardinal, who was to take the helm and act as viceroy during eighteen years.

Richelieu came into power at a lucky moment. Every one was sick of government by deputy; they desired a strong hand and an energetic foreign policy, after the defeat of the Czechs at the White Mountain and the house of Austria, the Spanish intrigues in the Valteline, and the resumption of war between Spain and Holland. Richelieu contrived to raise hope in the minds of all. As president of the council at the states-general of 1614 he had figured as an adherent of Spain and the ultramontane interest; he appeared to be a representative of that religious party which was identical with the Spanish party. But he had been put into the ministry by the party of the Politiques, who had terminated the civil wars, acclaimed Henry IV., applauded the Protestant alliance, and by the mouth of Miron, president of the third estate, had in 1614 proclaimed his intention to take up the national tradition once more. Despite the concessions necessary at the outset to the partisans of a Catholic alliance, it was the programme of the Politiques that Richelieu adopted and laid down with a master's hand in his Political Testament.

To realize it he had to maintain his position. This was very difficult with a king who "wished to be governed and yet was impatient at being governed." Incapable of applying himself to great affairs, but of sane and even acute judgment, Louis XIII. excelled only in a passion for detail and for manual pastimes. He realized the superior qualities of his minister, though with a lively sense of his own dignity he often wished him more discreet and less imperious; he had confidence in him but did not love him. Cold-hearted and formal by nature, he had not even self-love, detested his wife Anne of Austria—too good a Spaniard—and only attached himself fitfully to his favourites, male or female, who were naturally jealously suspected by the cardinal. He was accustomed to listen to his mother, who detested Richelieu as her ungrateful protegé. Neither did he love his brother, Gaston of Orleans, and the feeling was mutual; for the latter, remaining for twenty years heir-presumptive to a crown which he could neither fill nor, posing as the beloved prince in all the conspiracies against Richelieu, and issued from them each time as a Judas. Add to this that Louis XIII., like Richelieu himself, had wretched health, aggravated by the extravagant medicines of the day; and it is easy to understand how this pliable disposition which offered itself to the yoke caused Richelieu always to fear that his king might change his master, and to declare that "the four square feet of the king's cabinet had been more difficult for him to conquer than all the battlefields of Europe."

Richelieu, therefore, passed his time in safeguarding himself from his rivals and in spying upon them; his suspicious nature, rendered still more irritable by his painful practice of a dissimulation repugnant to his headstrong character, making him fancy himself threatened more than was actually the case. He brutally suppressed six great plots, several of which were scandalous, and had more than fifty persons executed; and he identified himself with the king, sincerely believing that he was maintaining the royal authority and not merely his own. He had a preference for irregular measures rather than legal prosecutions, and a jealousy of all opinions save his own. He maintained his power through the terror and of special commissions. It was Louis XIII. whose cold decree ordained most of the rigorous sentences, but the stain of blood rested on the cardinal's robe and made his reasons of state pass for private vengeance. Chalais was beheaded at Nantes in 1626 for having upheld Gaston of Orleans in his refusal to wed Mademoiselle de Montpensier, and Marshal d'Ornano died at Vincennes for having given him bad advice in this matter; while the duelist of Boutteville was put to the torture for having bravely the edict against duels. The royal family itself was not free from his attacks; after the Day of Dupes (1630) he allowed the queen-mother to die in exile, and publicly dishonoured the king's brother Gaston of Orleans by the publication of his confessions; Marshal de Marillac was put to the torture for his ingratitude, and the constable de Montmorency for rebellion (1632). The birth of Louis XIV. in 1638 confirmed Richelieu in power. However, at the point of death he roused himself to order the execution of the king's favourite, Cinq-Mars, and his friend de Thou, guilty of treason with Spain (1642).

Absolute authority was not in itself sufficient; much money was also needed. In his state-papers Richelieu has shown that at the outset he desired that the Huguenots should cease to behave as rebellious subjects, and the powerful provincial governors as suzerains over the lands committed to their charge. With his passion for the uniform and the useful on a grand scale, he hoped by means of the Code...
Michaud to put an end to the sale of offices, to lighten imposts, to suppress brigandage, to reduce the monasteries, &c. To do this it would have been necessary to make peace, for it was soon evident that war was incompatible with these reforms. He chose war, as did his Spanish rival and contemporary Olivares. War is expensive sport; but Richelieu maintained a lofty attitude towards finance, disdained figures, and abandoned all petty details to subordinate officials like D'Éfiat or Bullion. He therefore soon reverted to the old and worse measures, including the debasement of coinage, and put an extreme tension on all the springs of the financial system. The land-tax was doubled and trebled by war, by the pensions of the nobles, by an extortion the profits of which Richelieu disdained neither for himself nor for his family; and just when the richer and more powerful classes had been freed from taxes, causing the wholesale oppression of the poorer, these few remaining were jointly and sincerely answerable. Perquisites, offices, forced loans were multiplied to such a point that a critic of the times, Guy Patin, facetiously declared that duties were to be exacted from the beggars basking in the sun. Richelieu went so far as to make poverty systematic and use famine as a means of government. This was the price paid for the national victories.

Thus he procured money by an extremely crude, fiscal judgement which ended by exterminating the people; hence numerous insurrections of the poverty-stricken; Dijon rose in revolt against the aides in 1630, Provence against the tax-officers (dîtes) in 1631, Paris and Lyons in 1632, and Bordeaux against the increase of customs in 1635. In 1636 the Croquants ravaged Limousin, Poitou, Angoumois, Gascony and Périgord; in 1639 it needed an army to subdue the Vo-nu-pieds (bare-feet) in Normandy. Even the rentiers of the Hôtel-de-Ville, big and little, usually very peaceable folk, were excited by the curtailment of their incomes, and in 1639 and 1642 were roused to fury. Every one had to bend before this harsh genius, who insisted on uniformity in obedience. After the feudal vassals, decimated by the wars of religion and the executioner's hand, and after the recalcitrant taxpayers, the Protestants, in their turn, and by their own fault, experienced this.

While Richelieu was opposing the designs of the pope and of the Spaniards in the Valtellina, while he was arming the duke of Savoy and subsidizing Manfredi in Germany, Henry IV was making his peace with Spain. When de Soubise, the Protestant chiefs, took the initiative in a fresh revolt despite the majority of their party (1635). This Huguenot rising, in stirring up which Spanish diplomacy had its share, was a revolt of discontented and ambitious individuals who trusted for success to their compact organization and the ultimate assistance of England. Under pressure of this new danger and urged on by the Catholic dévots, supported by the influence of Pope Urban VIII, Richelieu concluded with Spain the treaty of Monzon (March 5, 1626), by which the interests of his allies Venice, Savoy and the Grisons were sacrificed without their being consulted. The Catholic Valtellina, freed from the claims of the Protestant Grisons, became an independent state under the joint protection of France and Spain; the question of the right of passage was left open, to trouble France during the campaigns that followed; but the immediate gain, so far as Richelieu was concerned, was that his hands were freed to deal with the Huguenots.

Soubise had begun the revolt (January 1625) by seizing Port Blavet in Brittany, with the royal squadron that lay there, and in concert of the ships thus acquired, combined with those of La Rochelle, he ranged the western coast, intercepting commerce. In September, however, Montmorency succeeded, with a fleet of English and Dutch ships manned by English seamen, in defeating Soubise, who took refuge in England. La Rochelle was now invested, the Huguenots were hard pressed also on land, and, but for the reluctance of the Dutch to allow their ships to be used for such a purpose, an end might have been made of the Protestant opposition in France; as it was, Richelieu was forced to accept the mediation of England and conclude a treaty with the Huguenots (February 1626).

He was far, however, from forgiving them for their attitude or being reconciled to their power. So long as they retained their compact organization in France he could undertake no successful action abroad, and the treaty was in effect nothing more than a truce that was badly observed. The oppression of the French Protestants was but one of the pretexts for the English expedition under James I.'s favourite, the duke of Buckingham, to La Rochelle in 1627; and, in the end, this intervention of a foreign power compromised their cause. When at last the citizens of the great Huguenot stronghold, caught between two dangers, chose what seemed to them the least and threw in their lot with the English, they definitely proclaimed their attitude as anti-national; and when, on the 29th of October 1628, after a heroic resistance, the city surrendered to the French king, this was hailed not as a victory for Catholicism only, but for France. The taking of La Rochelle was a crushing blow to the Huguenots, and the desperate alliance which Rohan, entrenched in the Cévennes, entered into with Philip IV. of Spain, could not prolong their resistance. The amnesty of Alais, prudent and moderate in religious matters, gave back to the Protestants their common rights within the body politic. Unfortunately what was an end for Rohan was a beginning for France, and with the siege of La Rochelle the Protestant group eliminated, Richelieu next wished to establish Catholic religious uniformity; for though in France the Catholic Church was the state church, unity did not exist in it. There were no fixed principles in the relations between king and church, hence incessant conflicts between Gallicans and Ultramontanes, in which Richelieu claimed to hold an even balance. Moreover, a Catholic movement for religious reform in the Church of France began during the 17th century, marked by the creation of seminaries, the foundation of new orthodox religious orders, and the organization of public relief by Saint Vincent de Paul. Jansenism was the most vigorous contemporary effort to renovate not only morals but Church doctrine (see Jansenism). But Richelieu had no love for innovators, and showed this very plainly to du Vergier de Hauranne, abbot of Saint Cyran, who was imprisoned at Vincennes for the good of Church and State.

In affairs of intellectual dragooning was equally the policy; and, as Corneille learnt to his cost, the French Academy was created in 1635 simply to suppress the circulation of books, to preserve the unity and conformity to rules that was enforced. Before Richelieu, there had been no effective monopoly and no institutions for controlling affairs; merely advisory institutions which collaborated somewhat vaguely in the administration of the kingdom. Had the king been willing these might have developed further; but Richelieu ruthlessly suppressed all such growth, and they remained embryonic. According to him, the king must decide in secret, and the king's will must be law. No one might meddle in political affairs, neither parlements nor states-general; still less had the public any right to judge the actions of the government. Between 1631 and the edict of February 1641 Richelieu strove against the continually renewed opposition of the parlements to his system of special commissions and judgments; in 1641 he refused them any right of interference in state affairs; at most would he consent occasionally to take counsel with assemblies of notables. Provincial and municipal liberties were no better treated when through them the king's letters patent to seigniors of the royal counties and intendances. In Brittany and Dauphiné, where his municipal liberties restricted in 1631; the provincial assembly of Dauphiné was suppressed from 1628 onward, and that of Languedoc in 1629; that of Provence was in 1639 replaced by communal assemblies, and that of Normandy was prorogued from 1639 to 1642. Not that Richelieu was hostile to them in principle; but he was obliged at all hazards to find money for the upkeep of the army, and the provincial states were a slow and heavy machine to put in motion. Through an excessive reaction against the disintegration that had menaced the kingdom after the dissolution of the League, he fell into the abuse of
over-centralization; and depriving the people of the habit of criticizing governmental action, he taught them a fatal acquiescence in uncontrolled and undisputed authority. Like one of those physical forces which tend to reduce everything to a dead level, he battered down alike characters and fortunes; and in his endeavours to abolish faction, he killed that public spirit which, formed in the 16th century, had already produced the République de Bodin, de Thou’s History of his Times, La Boëtie’s Contre un, the Soirée Ménipée, and Sully’s Économies royales.

In order to establish this absolute despotism Richelieu created no new instruments, but made use of a revolutionary institution of the 16th century, namely “intendants” (q.v.), agents who were forerunners of the commissioners of the Convention, gentlemen of the long robe of inferior condition, hated by every one, and for that reason the more trustworthy. He also drew most of the members of his special commissions from the grand council, a supreme administrative tribunal which owed all its influence to him.

However, having accomplished all these great things, the treasury was left empty and the reforms were but ill-established: for Richelieu’s policy increased poverty, neglected the toiling and suffering peasants, deserted the cause of the workers in order to favour the privileged classes, and left idle and useless that bourgeoisie whose intellectual activity, spirit of discipline, and civil and political culture would have yielded solid support to a monarchy all the stronger for being limited. Richelieu completed the work of Francis I.; he endowed France with the fatal tradition of autocracy. This priest by education and by turn of mind was indifferent to material interests, which were secondary in his eyes; he could organize neither finance, nor justice, nor an army, nor the colonies, but at the most a system of police. His method was not to reform, but to crush. He was great chiefly in negotiation, the art par excellence of ecclesiastics. His work was entirely abroad; there it had more continuity, more future, perhaps because only in his foreign policy was he unhampered in his designs. He sacrificed everything to it; but he ennobled it by the genius and audacity of his conceptions, by the energetic tension of all the muscles of the body politic.

The Thirty Years’ War in fact dominated all Richelieu’s foreign policy; by it he made France and unmade Germany.

It was the support of Germany which Philip II. had lacked in order to realize his Catholic empire; and the election of the archduke Ferdinand II. of Styria as emperor gave that support to his Spanish cousins (1619). Thenceforward all the forces of the Habsburg monarchy would be united, provided that communication could be maintained in the north with the Netherlands and in the south with the duchy of Milan, so that there should be no flaw in the iron vice which locked France in on either side. It was therefore of the highest importance to France that she should dominate the valleys of the Alps and Rhine. As soon as Richelieu became minister in 1624 there was an end to cordial relations with Spain. He resumed the policy of Henry IV., confining his military operations to the region of the Alps, and contending himself first at with opposing the coalition of the Habsburgs with a coalition of Venice, the Turks, Bethlen Gabor, king of Hungary, and the Protestants of Germany and Denmark. But the revolts of the French Protestants, the resentment of the nobles at his dictatorial power, and the perpetual ferment of intrigues and treason in the court, obliged him almost immediately to draw back. During these eight years, however, Richelieu had pressed on matters as fast as possible.

While James I. of England was trying to get a general on the cheap in Denmark to defend his son-in-law, the elector palatine, Richelieu was bargaining with the Spaniards in the treaty of Monzon (March 1636); but as the strained relations between France and England forced him to conclude a treaty with Spain still further by the treaty of April 1627, the Spaniards profited by this to carry on an intrigue with Rohan, and in concert with the duke of Savoy, to occupy Montferrat when the death of Vicenzo II. (December 26, 1627) left the succession of Mantua, under the will of the late duke, to Charles Gonzaga, duke of Nevers, a Frenchman by education and sympathy. But the taking of La Rochelle allowed Louis to force the pass of Susa, to induce the duke of Savoy to treat with him, and to isolate the Spaniards in Italy by a great Italian league between Genoa, Venice and the dukes of Savoy and Mantua (April 1629). Unlike the Valois, Richelieu only desired to free Italy from Spain in order to restore her independence.

The fact that the French Protestants in the Cévennes were again in arms enabled the Habsburgs and the Spaniards to make a fresh attack upon the Alpine passes; but after the peace of Alais Richelieu placed himself at the head of forty thousand men, and stirred up armies everywhere against the emperor, victorious now over the king of Denmark as in 1621 over the elector palatine. He united Sweden, now reconciled with Poland, and the Catholic and Protestant electors, disquieted by the edict of Restitution and the omnipotence of Wallenstein; and he aroused the United Provinces. But the disaffection of the court and the more extreme Catholics made it impossible for him, as yet to enter upon a struggle against both Austria and Spain; he was only able to regulate the affairs of Italy with much prudence. The intervention of Mazarin, despatched by the pope, who saw no other means of detaching Italy from Spain than by introducing France into the affair, brought about the signature of the armistice of Rivalte on the 4th of September 1630, soon developed into the peace of Cherasco, which established the agreement with the still fugitive duke of Savoy (June 1631). Under the harsh tyranny of Spain, Italy was now nothing but a lifeless corpse; young vigorous Germany was better worth saving. So Richelieu’s envos, Brutal de Léon and Father Joseph, disarmed 1 the emperor at the diet of Regensburg, while at the same time Louis XIII. kept Casale and Pinerolo, the gates of the Alps. Lastly, by the treaty of Fontainebleau (May 30th, 1631), Maximilian of Bavaria, the head of the Catholic League, engaged to defend the king of France against all his enemies, even Spain, with the exception of the emperor. And by the hand of Richelieu a union against Austrian imperialism was effected between the Bavarian Catholics and the Protestants who dominated in central and northern Germany.

Twice had Richelieu, by means of the purse and not by force of arms, succeeded in reopening the passes of the Alps and of the Rhine. The kingdom at peace and the Huguenots party ruined, he was now able to engage upon his policy of prudent acquisitions and apparently disinterested alliances. But Gustavus Adolphus, king of Sweden, called in by Richelieu and Venice to take the place of the played-out king of Denmark, brought danger to all parties. He would not be content merely to serve French interests in Germany, according to the terms of the secret treaty of Bärwalde (June 1631); but, once master of Germany and the rich valley of the Rhine, considered chiefly the interests of Protestantism and Sweden. Neither the prayers nor the threats of Richelieu, who wished indeed to destroy Spain but not Catholicism, nor the death of Gustavus Adolphus at Lützen (1632), could repair the evils caused by this immoderate ambition. Thus the violent Catholic reaction against the Protestants endeared; and the union of Spain and the Empire was consolidated just when that of the Protestants was dissolved at Nördlingen, despite the efforts of Oxenstierna (September 1634). Moreover, Wallenstein, who had been urged by Richelieu to set up an independent kingdom in Bohemia, had been killed on the 23rd of February 1634. In the course of a year Württemberg and Franconia were reconquered from the Swedes; and the dukes of Lorraine, who had taken the side of the Empire, called in the Spanish and the imperial forces to open the road to the Netherlands through Franche-Comté.

His allies no longer able to stand alone, Richelieu was obliged to intervene directly (May 10th, 1635). By the treaty of Saint-Germain-en-Laye he purchased the army of Bernard of Saxe-

1. Ferdinand is reported to have said: "Le capucin m’a désarmé avec son scapulaire et a mis dans capuchon six bonnets étoffés."
Weimar; by that of Rivoli he united against Spain the dukes of Modena, Parma and Mantua; he signed an open alliance with the league of Heilbronn, the United Provinces and Sweden, and after these alliances military operations began. Marshal de la Force occupying the duchy of Lorraine. Richelieu attempted to operate simultaneously in the Netherlands by joining hands with the Dutch, and on the Rhine by uniting with the Swedes; but the bad organization of the French armies, the double invasion of the Spaniards as far as Corbie and the imperial forces as far as the gates of Saint-Jean-de-Losne (1636), and the death of his allies, the dukes of Hesse-Cassel, Savoy and Mantua at first frustrated his efforts. A decided success was, however, achieved between 1638 and 1640, thanks to Bernard of Saxe-Weimar and afterwards to Guébriant, and to the parallel action of the Swedish generals, Banér, Wrangel and Torstensson. Richelieu obtained Alsace, Breisach and the forest-towns on the Rhine; while in the north, thanks to the Dutch and owing to the conquest of Artois, marshals de la Meilleraie, de Châtillon and de Brézé forced the barrier of the Netherlands. Turin, the capital of Piedmont, was taken by Henri de Lorraine, comte d’Harcourt; the alliance with rebellious Portugal facilitated the occupation of Roussillon and almost the whole of Catalonia, and Spain was reduced to defending herself; while the embarrassments of the Habsburgs at Madrid made those of Vienna more tractable. The diet of Regensburg, under the mediation of Maximilian of Bavaria, and the general peace of France, of the 25th of December 1641, the preliminary settlement at Hamburg fixed the opening of negotiations to take place at Münster and Osnabrück. Richelieu’s death (December 4, 1642) prevented him from seeing the triumph of his policy, but it can be judged by its results; in 1644 the kingdom had in the east only the frontier of the Meuse to defend it from invasion; in 1646 the whole of Alsace, except Strassburg, was occupied and the Rhine guarded by the army of Guébriant. Six months later, on the 14th of May 1643, Louis XIII. rejoined his minister in his true kingdom, the land of shades.

But thanks to Mazarin, who completed his work, France gathered in the harvest sown by Richelieu. At the outset no one believed that the new cardinal would have any success. Every one expected from Anne of Austria a change in the government which appeared to be justified by the persecutions of Richelieu and the disdainful unscrupulousness of Louis XIII. On the 16th of May the queen took the little four-year-old Louis XIV. to the parlement of Paris which, proud of playing a part in politics, hastened, contrary to Louis XIII.’s last will, to acknowledge the command of the little king, and to give his mother ‘free, absolute and entire authority.’ The great nobles were already looking upon themselves as established in power, when they learnt with amazement that the regent had appointed as her chief adviser, not Gaston of Orleans, but Mazarin. The political revenge which in their eyes was owing to them as a body, the queen claimed for herself alone, and she made it a romantic one. This Spaniard of waning charms, who had been neglected by her husband and insulted by Richelieu, now gave her indolent and full-blown person, together with absolute power, into the hands of the Sicilian. Whilst others were triumphing openly, Mazarin, in the shadow and silence of the interregnum, had kept watch upon the heart of the queen; and when the old party of Marie de’ Medici and Anne of Austria wished to come back into power, to impose a general peace, and to substitute for the Protestant alliances an understanding with Spain, the arrest of François de Vendôme, duke of Beaulort, and the exile of other important nobles proved to the great families that their hour had gone by (September 1643).

Mazarin justified Richelieu’s confidence and the favour of Anne of Austria. It was upon his foreign policy that he relied to maintain his authority within the kingdom. Thanks to him, the duke of Enghien (Louis de Bourbon, afterwards prince of Condé), appointed commander-in-chief at the age of twenty-two, caused the downfall of the renowned Spanish infantry at Rocroi; and he discovered Turenne, whose prudence tempered Condé’s overbold ideas. It was he too who by renewing the traditional alliances and resuming against Bavaria, Ferdinand III.’s most powerful ally, the common action with Sweden which Richelieu had sketched out, pursued it year after year: in 1644 at Freiburg im Breisgau, despite the death of Guébriant at Rottweil; in 1645 at Nördlingen, despite the defeat of Marienthal; and in 1646 in Bavaria, despite the rebellion of the Weimar cavalry; to see it finally triumph at Zumsmarshausen in May 1648. With Turenne dominating the Eiser and the Inn, Condé victorious at Lens, and the Swedes before the gates of Prague, the emperor, left without a single ally, finally authorized his plenipotentiaries to sign on the 24th of October 1648 the peace about which negotiations had been going on for seven years. Mazarin had stood his ground notwithstanding the treachery of the duke of Bavaria, the defection of the United Provinces, the resistance of the Germans, and the general confusion which was already pervading the internal affairs of the kingdom.

The dream of the Habsburgs was shattered. They had wished to set up a centralized empire, Catholic and German; but the treaties of Westphalia kept Germany in its passive and fragmentary condition; while the Catholic and Protestant princes obtained formal recognition of their territorial independence and their religious equality. Thus disappeared the two principles which justified the Empire’s existence; the universal sovereignty to which it laid claim was limited simply to a German monarchy much crippled in its powers; and the enfranchisement of the Lutherans and Calvinists from papal jurisdiction cut the last tie which bound the Empire to Rome. The victors’ material benefits were no less substantial: the congress of Münster ratified the final cession of the Three Bishoprics and the conquest of Alsace, and Breisach and Philippusburg completed these acquisitions. The Spaniards had no longer any hope of adding Luxemburg to their Franche-Comté; while the Holy Roman Empire in Germany, taken in the rear by Sweden (now mistress of the Baltic and the North Sea), cut off for good from the United Provinces and the Swiss cantons, and enfeebled by the recognized right of intervention in German affairs on the part of Sweden and France, was now nothing but a meaningless name.

Mazarin had not been so fortunate in Italy, where in 1642 the Spanish remained masters. Venice, the duchy of Milan and the duke of Modena were on his side; the pope and the grand-duke of Tuscany were trembling, but the romantic expedition of the duke of Guise to Naples, and the outbreak of the Fronde, saved Spain, who had refused to take part in the treaties of Westphalia and whose ruin Mazarin wished to compass.

It was, however, easier for Mazarin to remodel the map of Europe than to govern France. There he found himself face to face with all the difficulties that Richelieu had neglected to solve, and that were now once more giving trouble. The Lit de Justice of the 18th of May 1643 had proved authority to remain still so personal an affair that the person of the king, insignificant though that was, continued to be regarded as its absolute depositary. Thus regular obedience to an abstract principle was under Mazarin as incomprehensible to the idle and selfish nobility as it had been under Richelieu. The parlement still kept up the same extra-judicial pretensions; but beyond its judicial functions it acted merely as a kind of town-crier to the monarchy, charged with making known the king’s edicts. Yet through its right of remonstrance it was the only body that could legally and publicly intervene in politics; a large and independent body, moreover, which had its own demands to make upon the monarchy and its ministers. Richelieu, by setting his special agents above the legal but complicated machinery of financial administration, had so corrupted it as to necessitate radical reform; all the more so because financial charges had been increased to a point far beyond what the nation could bear. With four armies to keep up, the insurrection in Portugal to maintain, and pensions to serve the needs of the allies, the burden had become a crushing one.
Richelieu had been able to surmount these difficulties because he governed in the name of a king of full age, and against isolated adversaries; while Mazarin had the latter against him in a coalition which had lasted ten years, with the further disadvantages of his foreign origin and a royal minority at a time when every one was sick of government by ministers. He was the very opposite of Richelieu, as wheeling in his ways as the other had been haughty and scornful, as devoid of vanity and rancour as Richelieu had been full of jealous care for his authority; he was gentle where the other had been passionate and irritable, with an intelligence as great and more supple, and a far more grasping nature.

It was the fiscal question that arrayed against Mazarin a coalition of all petty interests and frustrated ambitions; this was always the Achilles' heel of the French monarchy, which in 1648 was at the last extremity for money.

All imposts were forestalled, and every expedient for obtaining either direct or indirect taxes had been exhausted by the methods of the financiers. As the country districts could yield nothing more, it became necessary to demand money from the Parisians and from the citizens of the various towns, and to search out and furbish up old disused edicts — edicts as to measures and scales of prices — at the very moment when the luxury and corruption of the 

parsennis

was insulting the poverty and suffering of the people, and exasperating all those officials who took their functions seriously.

A storm burst forth in the parlement against Mazarin as the patron of these expedients, the occasion for this being the edict of redemption by which the government renewed for nine years the " Paulette " which had now expired, by withholding four years' salary from all officers of the Great Council, of the Chambres des commettes, and of the Cours des aides. The parlement, although expressly exempted, associated itself with their protest by the decree of union of May 13, 1649, of which the other members of the state. Despite the queen's express prohibition, the insurrectionary assembly of the Chambre Saint Louis criticized the whole financial system, founded as it was upon usury, claimed the right of voting taxes, respect for individual liberty, and the suppression of the intendants, who were a menace to the new bureaucratic feudalism. The queen, haughty and exasperated though she was, yielded for the time being, because the invasion of the Spaniards in the north, the arrest of Charles I. of England, and the insurrection of Masaniello at Naples made the moment a critical one for monarchies; but immediately after the victory at Lens she attempted a coup d'état, arresting the leaders, and among them Broussel, a popular member of the parlement (August 26, 1648). Paris at once rose in revolt — a Paris of swarming and unpolic'd streets, that had been making French history ever since the reign of Henry IV., and that had not forgotten the barricades of the League. Once more a promise of yielding had to be made, until Condé's arrival enabled the court to take refuge at Saint-Germain (January 15, 1649).

Civil war now began against the rebellious coalition of great nobles, lawyers of the parlement, populace, and mercenaries just set free from the Thirty Years' War. It lasted four years, for motives often as futile as the Grande Mademoiselle's ambition to wed little Louis XIV., Cardinal de Retz's red hat, or Madame de Longueville's stool at the queen's side; it was, as its name of Fronde indicates, a hateful farce, played by grown-up children, in several acts.

Its first and shortest phase was the Fronde of the Parlement. At a period when all the world was a little mad, the parlement had imagined a loyalist revolt, and, though it raised an armed protest, this was not against the king but against Mazarin and the persons to whom he had delegated power. But the parlement soon became disgusted with its allies — the princes and nobles, who had only drawn their swords in order to beg more effectively with arms in their hands; and the Parisian mob, whose fanaticism had been aroused by Paul de Gondi, a warlike ecclesiastic, a Catiline in a cassock, who preached the gospel at the dagger's point.

When a suggestion was made to the parlement to receive an envoy from Spain, the members had no hesitation in making terms with the court by the peace of Rueil (March 11, 1649), which ended the first Fronde.

As an entr'acte, from April 1649 to January 1650, came the affair of the Petits Maitres: Condé, proud and violent; Gaston of Orleans, pliable and contemptible; Conti, the simpleton; and Longueville, the betrayed husband. The victim of Lens and Charenton imagined that every one was under an obligation to him, and laid claim to a dictatorship so insupportable that Anne of Austria and Mazarin — assured by Gondi of the concurrence of the parlement and people — had him arrested. To defend Condé the great conspiracy of women was formed: Madame de Chevreuse, the subtle and impassioned princess palatine, and the princess of Condé vainly attempted to arouse Normandy, Burgundy and the mob of Bordeaux; while Turenne, bewitched by Madame de Longueville, after several days of conflict with Spain and was defeated at Rethel (December 15, 1650). Unfortunately, after his custom when victor, Mazarin forgot his promises — above all, Gondi's cardinal's hat. A union was effected between the two Frondes, that of the Petits Maitres and that of the parlements, and Mazarin was obliged to flee for safety to the electorate of Cologne (February 1651), whence he continued to govern the queen and the kingdom by means of secret letters. But the heads of the two Frondes — Condé, now set free from prison at Havre, and Gondi who detested him — were not long in quarrelling fatally. Owing to Mazarin's exile and to the king's attainment of his majority (September 5, 1651) quiet was being restored, when the return of Mazarin, jealous of Anne of Austria, nearly brought about another reconciliation of all his opponents (January 1652). Condé resumed civil war with the support of Spain, because he was not given Mazarin's place; but though he defeated the royal army at Bléneau, he was surprised at Étampes, and nearly crushed by Turenne at the gate of Saint-Antoine. Saved, however, by the Grande Mademoiselle, daughter of Gaston of Orleans, he lost Paris by the disaster of the Hôtel de Ville July 4, 1652), where he had installed an insurrectionary government. A general weariness of civil war gave second place to the agents of Mazarin, who in order to facilitate peace made a pretence of exiling himself for a second time to Bouillon. Then came the final collapse: Condé having taken refuge in Spain for seven years, Gaston of Orleans being in exile, Retz in prison, and the parlement reduced to its judiciary functions only, the field was left open for Mazarin, who, four months after the king, re-entered in triumph that Paris which had driven him forth with jeers and mockery (February 1653).

The task was now to repair these four years of madness and folly. The nobles who had hoped to set up the League again, half counting upon the king of Spain, were held in check by the Mazarin, whose odious policies and the number of his enemies, and were now employed by him in warfare and in decorative court functions; while others, De Retz and La Rochefoucauld, sought consolation in their Memoirs or their Maxims, one for his mortifications and the other for his rancour as a statesman out of employment. The parlement, which had confused political power with judiciary administration, was given to understand, in the session of April 13, 1655, at Vincennes, that the era of political manifestations was over; and the money expended by Gourville, Mazarin's agent, restored the members of the parlement to docility.

The power of the state was confided to middle-class men, faithful servants during the evil days: Abel Servien, Michel le Tellier, Hugues de Lionne. Like Henry IV. after the League, Mazarin, after having conquered the Fronde, had to buy back bit by bit the kingdom he had lost, and, like Richelieu, he spread out a network of agents, thenceforward regular and permanent, who assured him of that security without which he could never have carried on his vast plunderings in peace and quiet. His imitator and superintendent, Fouquet, the Maecenas of the future Augustus, concealed this gambling policy beneath the lustre of the arts and the glamour of a literature remarkable for
FRANCE

The death of Colbert and the revocation of the edict of Nantes brought the first to a close (1661-1683-1685); coinciding with the date when the Revolution in England definitely reversed the traditional system of alliances, and when the administration began to disorganize. In the second period (1685-1715) all the germs of decadence were developed until the moment of final dissolution.

In a monarchy so essentially personal the preparation of the heir to the throne by and by and by his position should have been the chief task. Anne of Austria, a devoted but unintelligent mother, knew no method of dealing with her son, save devotion combined with the rod. His first preceptors were nothing but courtiers; and the most intelligent, his valet Laporte, developed in the royal child's mind his natural instinct of command, a very lively sense of his rank, and that nobly majestic air of master of the world which he preserved even in the commonest actions of his life. The continual agitations of the Fronde prevented him from persevering in any consistent application during those years which are the most valuable for study, and only instilled in him a horror of revolution, parliamentary remonstrance, and disorder of all kinds; so that this recollection determined the direction of his government. Mazarin, in his later years, at last taught him his trade as king by admitting him to the council, and by instructing him in the details of politics and of administration.

In 1661 Louis XIV. was a handsome youth of twenty-two, of splendid health and gentle serious mien; eager for pleasure, but discreet and even dissimulating; his rather mediocre intellectual qualities relieved by solid common sense; fully alive to his rights and his duties.

The duties he conscientiously fulfilled, but he considered he need render no account of them to any one but his Maker, the last humiliation for God's viceroy being "to take the law from his people." In the solemn language of the "Memoirs for the Instruction of the Dauphin" he did but affirm the arbitrary and capricious character of his predecessors' action. As for his rights, Louis XIV. looked upon these as plenary and unlimited. Representative of God upon earth, heir to the sovereignty of the Roman emperors, a universal suzerain and master over the goods and the lives of his vassals, he could conceive no other bounds to his authority than his own interests or his obligations towards God, and in this he was a willing believer of Bossuet. He therefore had but two aims: to increase his power at home and to enlarge his kingdom abroad. The army and taxation were the chief instruments of his policy. Had not Bossuet, Hobbes and Bossuet taught that the force which gives birth to kingdoms serves best also to feed and sustain them? His theory of the state, despite Grotius and Jurieu, rejected as odious and even impious the notion of any popular rights, anterior and superior to his own. A realist in principle, Louis XIV. was terribly utilitarian and egotistical in practice; and he exacted from his subjects an absolute, continual and obligatory self-abnegation before his public authority, even when improperly exercised.

This deified monarch needed a new temple, and Versailles, where everything was his creation, both men and things, adored its maker. The highest nobility of France, beginning with the princes of the blood, competed for posts in the royal household, where an army of ten thousand soldiers, four thousand servants, and five thousand horses played its costly and luxurious part in the ordered and almost religious pageant of the king's existence. The "anciennes provinces de France," gay, familiar and military, gave place to a stiff court life, a perpetual adoration, a very ceremonious and very complicated ritual, in which the demigod "pontificated" even "in his dressing-gown." To pay court to himself was the first and only duty in the eyes of a proud and haughty prince who saw and noted everything, especially any one's absence. Versailles, where the delicate refinements of Italy and the grave politeness of Spain were fused and mingled with French vivacity, became the centre of national life and a model for foreign royalties; hence if Versailles has played a considerable part in the history of civilization, it also seriously modified the life of France.

Elegance and self-seek ing became the chief rules of a courtier's life, and this explains the division of the nobility into two sections: the provincial squires, embittered by neglect; and the courtiers, who were ruined materially and intellectually by their way of living. Versailles sterilized all the idle upper classes, exploited the industrious classes by its extravagance, and more and more broke relations between king and kingdom.

But however divine, the king could not wield his power unaided. Louis XIV. called to his assistance a hierarchy of humbly submissive functionaries, and cabinets over which he regularly presided. Holding the very name of roi paisissant in abhorrence, he abolished the office of mayor of the palace—that is to say, the prime minister—thus imposing upon himself work which he always regularly performed. In choosing his collaborators his principle was never to select nobles or ecclesiastics, but persons of inferior birth. Neither the immense fortunes amassed by these men, nor the venality and robust vitality which made their families veritable races of ministers, altered the fact that De Lionne, Le Tellier, Louvois and Colbert were in themselves of no account, even though the parts they played were much more important than Louis XIV. imagined. This was the age of plebeians, to the great indignation of the duke and peer Saint Simon. Mere
reflected lights, these satellites professed to share their master's horror of all individual and collective rights of such a nature as to oppose any check upon his public authority. Louis XIV. detested the states-general and never convoked them, and the parlements were definitely reduced to silence in 1673; he completed the destruction of municipal liberties, under pretext of bad financial administration; suffered no public, still less private criticism; was ruthless when his exasperated subjects had recourse to force; and made the police the chief bulwark of his government. Prayers and resignation were the only solace left for the hardships endured by his subjects. All the ties of caste, class, corporation and family were severed; the jealous despotism of Louis XIV. destroyed every opportunity of taking common action; he isolated every man in private life, in individual interests, just as he isolated himself more and more from the body social. Freedom he tolerated for himself alone.

His passion for absolutism made him consider himself master of souls as well as bodies, and Bossuet did nothing to contravene an opinion which was, indeed, common to every sovereign of his day. Louis XIV., like Philip II., pretending to not only political but religious authority, would not allow the pope to share it, still less would he abide any religious dissent; and that gave rise to many conflicts, especially those in France which, at times, a temporal sovereign both at Rome and at Avignon, and as the head of Christendom bound to intervene in the affairs of France. Louis XIV.'s pride caused the first struggle, which turned exclusively upon questions of form, as in the affair of the Corsican Guard in 1662. The question of the right of regale (right of the Crown to the revenues of vacant abbies and bishoprics), which touched the essential rights of sovereignty, further inflamed the hostility between Innocent XI. and Louis XIV. Conformably with the traditions of the administrative monarchy in 1673, the king wanted to extend to the new additions to the kingdom his rights of receiving the revenues of vacant bishoprics and making appointments to their benefices, including taking oaths of fidelity from the new incumbents. A protest raised by the bishops of Pamiers and Aleth, followed by the seizure of their revenues, provoked the intervention of Innocent XI. in 1678; but the king was supported by the general assembly of the clergy, which declared that, with certain exceptions, the regale extended over the whole kingdom (1681). The pope ignored the decisions of the assembly; so, dropping the regale, the king demanded that, to obviate further conflict, the assembly should define the limits of the authority due respectively to the king, the Church and the pope. This was the object of the Declaration of the Four Articles: the pope has no power in temporal matters; general councils are superior to the pope in spiritual affairs; the rules of the Church of France are inviolable; decisions of the pope in matters of faith are only irrevocable by consent of the Church. The French laity transferred to the king this quasi-divine authority, which became the political theory of the ancien régime; and since the pope refused to submit, or to institute the new bishops, the Sorbonne was obliged to interfere. The affair of the "diplomatic prerogatives," when Louis XIV. was decidedly in the wrong, made relations even more strained (1687), and the idea of a schism was mooted with greater insistence than in 1681. The death of Innocent XI. in 1689 allowed Louis XIV. to engage upon negotiations rendered imperative by his check in the affair of the Cologne bishopric, where his candidate was ousted by the pope's. In 1693, under the pontificate of Innocent XII., he went, like so many others, to Canossa.

Recipient now of immense ecclesiastical revenues, which, owing to the number of vacant benefices, constituted a powerful engine of government, Louis XIV. had immense power over the French Church. Religion began to be identified with the state; and the king combated heresy and dissent, not only as a religious duty, but as a matter of political expediency, unity of faith being obviously conducive to unity of law.

Richelieu having deprived the Protestants of all political guarantees for their liberty of conscience, an anti-Protestant party (directed by a cabal of religious devotees, the Compagnie du Saint Sacrement) determined to suppress it completely by conversions and by a Jesuitical interpretation of the terms of the edict of Nantes. Louis XIV. made this impolitic policy his own. His passion for absolutism, a religious zeal that was the more active because it had to compensate for many affronts to public and private morals, the financial necessity of augmenting the free donations of the clergy, and the political necessity of relying upon that body in his conflicts with the pope, led the king between 1661 and 1668 to embark upon a double campaign of arbitrary proceedings with the object of nullifying the edict, conversions being procured either by force or by bribery. The promulgation and application of systematic measures from above had a response from below, from the corporation, the urban workshop, and the village street, which supported ecclesiastical and royal authority in its suppression of heresy, and frequently even went further: individual and local fanaticism co-operating with the head of the state, the intendants, and the military and judiciary authorities. Protestants were successively removed from the states-general, the consulates, the town councils, and even from the humblest municipal offices; they were deprived of the charge of their hospitals, their academies, their colleges and their schools, and were subject to the most various limitations and prejudices. The influence of the clergy united with chicanery of procedure to invade their places of worship, insult their adherents, and put a stop to the practice of their ritual. Pellisson's methods of conversion, considered too slow, were accelerated by the violent persecution of Louvois and by the king's galleys, until the day came when Louis XIV., deceived by the clergy, crowned his record of compliant legal methods by revoking the edict of Nantes. This was the signal for a Huguenot renaissance, and the Camisards of the Cévennes held the royal armies in check from 1703 to 1711. Notwithstanding this, however, Louis XIV. succeeded only too well, since Protestantism was reduced both numerically and intellectually. He never perceived how its loss threw France back a full century, to the great profit of foreign nations; while neither did the Church perceive that she had been firing on her own troops.

The same order of ideas produced the persecution of the Jansenists, as much a political as a religious sect. Founded by a bishop of Ypres on the doctrine of predestination, and growing by persecution, it had speedily recruited adherents among the disillusioned followers of the Fronde, the Gallican clergy, the higher nobility, even at court, and more important still, among learned men and thinkers, such as the great Arnauld, Pascal and Racine. Pure and austere, it enjoined the strictest morals in the midst of corruption, and the most dignified self-respect in face of idolatrous servility. Amid general silence it was a formidable and much dreaded body of opinion; and in order to stifle it Louis XIV., the tool of his confessor, the Jesuit Le Tellier, made use of his usual means. The nuns of Port Royal were in their turn subjected to persecution, which, after a truce between 1666 and 1679, became aggravated by the affair of the regale, the bishops of Aleth and Pamiers being Jansenists. Port Royal was destroyed, the nuns dispersed, and the ashes of the dead scattered to the four winds. The bull Unigenitus launched by Pope Clement XI. in 1713 against a Jansenist book by Father Quesnel rekindled a quarrel, the end of which Louis XIV. did not live to see, and which raged throughout the 18th century.

Bossuet, Louis XIV.'s mouthpiece, triumphed in his turn over the quietism of Madame Guyon, a mystic who recognized neither definite dogmas nor formal prayers, but abandoned herself "to the torrent of the forces of God." Fénélon, who in his Maximes des Saints had given his adherence to her doctrine, was obliged to submit in 1699; but Bossuet could not make the spirit of authority prevail against the religious criticism of a Richard Simon or the philosophical polemics of a Bayle. He might exile their persons; but their doctrines, supported by the
scientific and philosophic work of Newton and Leibnitz, were to triumph over Church and religion in the 18th century.

The chaos of the administrative system caused difficulties no less great than those produced by opinions and creeds. Traditional rights, differences of language, provincial autonomy, ecclesiastical assemblies, parlements, governors, intendants—vestiges of the past, or promises for the future—all jostled against and thwarted each other. The central authority had not yet acquired a vigorous constitution, nor destroyed all the intermediary authorities. Colbert now offered his aid in making Louis XIV. the sole pivot of public life, as he had already become the source of religious authority, thanks to the Jesuits and to Bossuet.

Colbert, an agent of Le Tellier, the honest steward of Mazarin's dishonest fortunes, had a future opened to him by the fall of Fouquet (1661). Harsh and rough, he compelled admiration for his delight in work, his aptitude in disentangling affairs, his desire of continually augmenting the wealth of the state, and his regard for the public welfare without forgetting his own. Born in a draper's shop, this great administrator always preserved its spirit. He held the attitude of the parvenu; while with his insinuating ways, and knowing better than Fouquet how to keep his distance, he made himself indispensable by his savoir-faire and his readiness for every emergency. He gradually got everything into his control: finance, industry, commerce, the fine arts, the navy and colonies, the administration, even the fortifications—and through his uncle Pussot—the law, with all the profits attaching to its offices.

His first care was to restore the exhausted resources of the country and to re-establish order in finance. He began by measures of liquidation: the Chambre ordinaire of 1661 to 1665 to deal with the farmers of the revenue, the condemnation of Fouquet, and a revision of the funds. Next, like a good man of business, Colbert determined that the state accounts should be kept as accurately as those of a shop; but though in this respect a great minister, he was less so in his manner of levying contributions. He kept to the old system of revenues from the demesne and from imposts that were reactionary in their effect, such as the taille, aids, salt-tax (gabelle) and customs; only he managed them better. His forest laws have remained a model. He demanded less of the taille, a direct impost, and more from indirect aids, of which he created the code—not, however, out of sympathy for the common people, towards whom he was very harsh, but because these aids covered a greater area and brought in larger returns. He tried to import more method into the very unequal distribution of taxation, less brutality in collection, less confusion in the fiscal machine, and more uniformity in the matter of rights; while he diminished the debts of the much-involved towns by putting them through the bankruptcy court. With revolutionary intentions as to reform, this only ended, after several years of normal budgets, in ultimate frustration. He could never make the rights over the drink traffic uniform and equal, nor restrict privileges in the matter of the taille; while he was soon faced with the coalition of local interests, and the decay of the communities, which made despotic acceptance by tempering it, but also by Louis XIV.'s two master-passions for conquest and for building. To his great chagrin he was obliged to begin borrowing again in 1672, and to have recourse to "affaires extraordinaires"; and this brought him at last to his grave.

Order was for Colbert the prime condition of work. He desired all France to set to work as he did "with a contended air and rubbing his hands for joy"; but neither general theories nor individual happiness preoccupied his attention. He made economy truly political: that is to say, the prosperity of industry and commerce afforded him no other interest than that of making the country wealthy and the state powerful. Louis XIV.'s aspirations towards glory chimed in very well with the extremely positive views of his minister; but here too Colbert was an innovator and an unsuccessful one. He wanted to give 17th-century France and the modern and industrial character which the New World had imprinted on the maritime states; and he created industry on a grand scale with an energy of labour, a prodigious genius for initiative and for organization; while, in order to attract a foreign clientele, he imposed upon it the habits of meticulous probity common to a middle-class draper. But he maintained the legislation of the Valois, who placed industry in a state of strict dependency on finance, and he instituted a servitude of labour harder even than that of individuals; his great factories of soap, glass, lace, carpets and cloth had the same artificial life as that of contemporary Russian industry, created and nourished by the state. It was therefore necessary, in order to compensate for the fatal influence of servitude, that administrative protection should be lavish without end upon the royal manufactures; moreover, in the course of its development, industry on a grand scale encroached in many ways upon the resources of smaller industries. After Colbert's day, when the crutches lent by privilege were removed, his achievements lost vigour. Industries that ministered to luxury alone escaped danger; but others where the continual, persistent and teasing opposition of the municipal bodies and the bourgeoisie—conceited, ignorant, and terrified at any innovation—and against the blind and intolerant policy of Louis XIV.

Colbert, in common with all his century, believed that the true secret of commerce and the indisputable proof of a country's prosperity was to sell as many of the products of national industry to the foreigner as possible, while purchasing as little as possible. In order to do this, he sometimes figured as a free-trader and sometimes as a protectionist, but always in a practical sense; if he imposed prohibitive tariffs, in 1664 and 1667, he also opened the free ports of Marseilles and Dunkirk, and engineered the Canal du midi. But commerce, like industry, was made to rely only on the instigation of the state, by the intervention of officials, here, as throughout the national life, private initiative was kept in subjection and under suspicion. Once more Colbert failed; with regard to internal affairs, he was unable to unify weights and measures, or to suppress the many custom-houses which made France into a miniature Europe; nor could he in external affairs reform the consulates of the Levant. He did not understand that, in order to purge the body of the nation from its traditions of routine, it would be necessary to reawaken individual energy in France. He believed that the state, or rather the bureaucracy, might be the motive power of national activity.

His colonial and maritime policy was the newest and most fruitful part of his work. He wished to turn the eyes of contemporary adventurous France towards her distant interests, the wars of religion having diverted her attention from them to the great profit of English and Dutch merchants. Here too he had no preconceived ideas; the royal and monopolist companies were never for him an end but a means; and after much experimenting he at length attained success. In the course of twenty years he created many dependencies beyond seas. To his colonial empire in America he added the greater part of Santo Domingo, Tobago and Dominica; he restored Guiana; prepared for the acquisition of Louisiana by supporting Cavelier de la Salle; extended the suzerainty of the king on the coast of Africa from the Bay of Arguin to the shores of Sierra Leone, and instituted the first commercial relations with India. The population of the Antilles doubled; that of Canada quintupled; while if in 1672 at the time of the war with Holland Louis XIV. had listened to him, Colbert would have sacrificed his pride to the acquisition of the rich colonies of the Netherlands. In order to attach and defend these colonies Colbert created a navy which became his passion; he took convicts to man the galleys in the Mediterranean, and for the fleet in the Atlantic he established the system of naval reserve which still obtains. But, in the 18th century, the monarchy, hypnotized by the classical battle-fields
of Flanders and Italy, madly squandered the fruits of Colbert's work as so much material for barter and exchange. In the administration, the prince and the law, Colbert preserved all the old machinery, including the inheritance of office. In the great codification of laws, made under the direction of his uncle Pussort, he set aside the parlement of Paris, and justice continued to be ill-administered and cruel. The police, instituted in 1667 by La Reynie, became a public force independent of magistrates and under the direct orders of the ministers, making the arbitrary royal and ministerial authority absolute by means of lettres de cachet (q.v.), which were very convenient for the government and very terrible for the individuals concerned.

Provincial administration was no longer modified; it was regularized. The intendant became the king's factotum, not purchasing his office but liable to dismissal, the government's confidential agent and the real repository of royal authority, the governor being only for show (see INTENDANT). Colbert's system went on working regularly up to the year 1675; from that time forward he was cruelly embarrassed for money, and, seeking new sources of revenue, suggested for subsidies the clergy and the seigneurs. He did not succeed either in stemming the tide of expense, nor in his administration, being in no way in advance of his age, and not perceiving that decisive reform could not be achieved by a government dealing with the nation as though it were inert and passive material, made to obey and to pay. Like a good Cartesian he conceived of the state as an immense machine, every portion of which should receive its impulse from outside—that is from him, Colbert. Leibnitz had not yet taught that external movement is nothing, and inward spirit everything. As the minister of an ambitious and magnifying king, Colbert was under the hard necessity of sacrificing everything to the wars in Flanders and the pomp of Versailles—a gulf which swallowed up all the country's wealth; and, amid a society which might be supposed submissively docile to the wishes of Louis XIV., he had to retain the most absurd financial laws, making the burden of taxation weigh heaviest on those who had no other resources than their labour, whilst landed property escaped free of charge. Habitual privation during one year in every three proved too painful to revolt: in Boulonnais, the Pyrenees, Vivarais, in Guenney from 1670 onwards and in Brittany in 1675. Cruel means of repression assisted natural hardships and the carelessness of the administration in depopulating and laying waste the countryside; while Louis XIV.'s martial and ostentatious policy was even more disastrous than pestilence and famine, when Louvois' advice prevailed in council over that of Colbert, now embittered and desperate. The revocation of the edict of Nantes vitiated through a fatal contradiction all the efforts of the latter to create new manufactures; the country was impoverished for the benefit of the foreigner to such a point that economic conditions began to alarm those private persons most noted for their talents, their character, or their regard for the public welfare; such as La Bruyère and Fénelon in 1662, Bois-Guillebert in 1697 and Vauban in 1707. The movement attracted even the ministers, Boulainvilliers at their head, who caused the intendants to make inquiry into the causes of this general ruin. Colbert was a volume of attack upon Colbert; but as the fundamental system remained unchanged, because reform would have necessitated an attack upon privilege and even upon the constitution of the monarchy, the evil only went on increasing. The social condition of the time recalls that of present-day Morocco, in the high price of necessaries and the extortions of the financial authorities; every man was either soldier, beggar or smuggler. Under Pontchartrain, Chamillard and Desmares, the expenses of the two wars of 1668 and 1701 attained to nearly five milliards. In order to cover this revenue was had as usual, not to remedies, but to pilliatives worse than the evil: heavy usurious loans, debasement of the coinage, creation of stocks that were perpetually being converted, and ridiculous charges which the bourgeois, sickened with officialdom, would endure no longer. Richelieu himself had hesitated to tax labour; Louis XIV. trod the trade organizations under foot. It was necessary to have recourse to revolutionary measures, to direct taxation, ignoring all class distinction. In 1665 the graduated poll-tax was a veritable coup d'etat against privileged persons, who were equally brought under the tax; in 1710 was added the tithe (dixième), a tax upon income from all landed property. Money scarce, men too were lacking; the institution of the militia, the first germ of obligatory enlistment, was a no less important innovation. But these were only provisional and desperate expedients, supponed upon the old routine, a further charge in addition to those already existing; and this entirely mechanical system, destructive of private initiative and the very sources of public life, worked with difficulty even in time of peace. As Louis XIV. made war continuously the result was the same as in Spain under Philip II.: depopulation and bankruptcy within the kingdom and the coalitions of Europe without.

In 1660 France was predominant in Europe; but she aroused nothing but contempt in the house of Habsburg, enfeebled and divided against itself. It was sufficient to remark, in the Ruin of Colbert's work. Foreign policy of Louis XIV. very soon altered, while yet claiming to continue it; he superseded it by one principle: that of replacing the proud tyranny of the Habsburgs of Spain by another. He claimed to lay down the law everywhere, in the preliminary negotiations between his ambassador and the Spanish ambassador in London, in the affair of the salute exacted from French vessels by the English, and in that of the Corsican guard in Rome; while he proposed to become the head of the crusade against the Turks in the Mediterranean as in Hungary. The eclipse of the great idea of the balance of power in Europe was no sudden affair; the most flourishing years of the reign were still enlightened by it: witness the repurchase of Dunkirk from Charles II. in 1662, the cession of the dukedoms of Bar and of Lorraine and the war against Portugal. But soon the partial or total conquest of the Spanish inheritance proved "the grandeur of his beginnings and the meanness of his end." Like Philip the Fair and Louis XIV., Louis of Hungary supported his foreign policy in that public opinion which in internal matters he held so cheap; and he found equally devoted auxiliaries in the jurists of his parlements.

It was thus that the first of his wars for the extension of frontiers began, the War of Devolution. On the death of his father-in-law, Philip IV. of Spain, he transferred into the realm of politics a civil custom of inheritance prevailing in Brabant, and laid claim to Flanders in the name of his wife Maria Theresa. The Anglo-Dutch War of Devolution, 1665-1667, in which he was by way of supporting the United Provinces without engaging his fleet, retarded this enterprise by a year. But after his mediation in the treaty of Breda (July 1667), when Hugues de Lionne, secretary of state for foreign affairs, had isolated Spain, he substituted soldiers for the jurists and cannon for diplomacy in the matter of the queen's rights.

The secretary of state for war, Michel Le Tellier, had organized his system and thanks to his great activity in reform, especially after the Frond, Louis XIV. found himself in possession of an army that was well equipped, well clothed, well provisioned, and very different from the rabble of the Thirty Years' War, fitted out by dishonest jobbing contractors. Severe discipline, suppression of fraudulent interchange, furnishing of clothes and equipment by the king, regulation of rank among the officers, systematic revictualling of the army, settled means of manufacturing and furnishing arms and ammunition, placing of the army under the direct authority of the king, abolition of great military charges, subordination of the governors of strongholds, control by the civil authority over the soldiers effected by means of paymasters and commissaries of stores; all this organization of the royal army was the work of le Tellier.
His son, François Michel le Tellier, marquis de Louvois, had one sole merit, that of being his father’s pupil. A purveyor of the middle classes, he was brutal in his treatment of the lower orders and a sycophant in his behaviour towards the powerful; prodigiously active, ill-occupied—as was the custom—but much dreaded. From 1667 onwards he did but finish perfecting Louis XIV’s army in accordance with the suggestions left by his father, and made no fundamental changes: neither the definite abandonment of the feudal arrière-ban and of recruiting—sources of disorder and insubordination—nor the creation of the militia, which allowed the nation to penetrate into all the ranks of the army, nor the adoption of the gun with the bayonet,—which was to become the ultima ratio of peoples as the cannon was that of sovereigns,—nor yet the uniform, intended to strengthen esprit de corps, were due to him. He maintained the institutions of the day, though seeking to diminish their abuse, and he perfected material details; but misfortune would have it that instead of remaining a great military administrator he flattered Louis XIV’s megalomania, and thus caused his perdixion.

Under his orders Turenne conquered Flanders (June-August 1667); and Contades—mother of the Duke of Beaufort—gave in, Condé occupied Franche Comté in fourteen days (February 1668). But Europe rose up in wrath; the United Provinces and England, jealous and disquieted by this near neighbourhood, formed with Sweden the triple alliance of the Hague (January 1668), ostensibly to offer their mediation, though in reality to prevent the occupation of the Netherlands. Following the advice of Colbert and de Lorraine, Louis XIV appeared to accede, and by the treaty of Aix-la-Chapelle he preserved his conquests in Flanders (May 1668).

This peace was neither sufficient nor definite enough for Louis XIV.; and during four years he employed all his diplomacy to isolate the republic of the United Provinces in Europe, as he had done for Spain. He wanted to ruin this nation both in a military and an economic sense, in order to annex to French Flanders the rest of the Catholic Netherlands allotted to him by a secret treaty for partitioning the Spanish possessions, signed with his brother-in-law the emperor Leopold on the 10th of January 1668. Colbert—very envious of Holland’s wealth—prepared the finances, le Tellier the army and de Lorraine the alliances. In vain did the grand pensionary of the province of Holland, Jean de Witt, offer concessions of all kinds; both England, bound by the secret treaty of Dover (January 1670), and France had need of this war. Avoiding the Spanish Netherlands, Louis XIV. effected the passage of the Rhine in June 1672; and the disarmed United Provinces, which had on their side only Brandenburg and Spain, were occupied in a few days. The brothers de Witt, in consequence of their fresh offer to treat at any price, were assassinated; the broken dykes of Muiden arrested the victorious march of Condé and Turenne; while the popular and military party, directed by the stadholder William of Orange, took the upper hand and preached resistance to the death.

"The war is over," said the new secretary of state for foreign affairs, Arnauld de Pomponne; but Louvois and Louis XIV. said no. The latter wished not only to take possession of the Netherlands, which were to be given up to him with half of the United Provinces and their colonial empire, he wanted “to play the Charlemagne,” to re-establish Catholicism in that country as Philip II. had formerly attempted to do, to occupy all the territory as far as the Lech, and to exact an annual oath of fealty. But the patriotism and the religious fanaticism of the Dutch revolted against this insupportable tyranny. Power had passed from the hands of the burghers of Amsterdam into those of William of Orange, who, on the 30th of August 1673, profiting by the arrest of the army brought about by the inunction and by the fears of Europe, joined in a coalition with the emperor, the king of Spain, the duke of Lorraine, many of the princes of the Empire, and with England, now at last enlightened as to the projects of Catholic restoration which Louis XIV. was planning with Charles II. It was necessary to evacuate and then to settle with the United Provinces, and to turn against Spain. After fighting for five years against the whole of Europe by land and by sea, the efforts of Turenne, Condé and Duquesne culminated at Nijmegen in fresh acquisitions (1678). Spain had to cede to Louis XIV., Franche Comté, Dunkirk and half of Flanders. This was another natural and glorious result of the treaty of the Pyrenees. The Spanish monarchy was disarmed.

But Louis XIV. had already manifested that unmeasured and restless passion for glory, that claim to be the exclusive arbiter of western Europe, that blind and narrow insistence, which were to bear out his motto “Seul contre tous.” Whilst all Europe was disarming he kept his troops, and used peace as a means of conquest. Under orders from Colbert de Croissy the jurists came upon the scene once more, and their unjust decrees were sustained by force of arms. The Chambres de Réunion sought for and to the kingdom those lands which were not actually dependent upon his new conquests, but which had formerly been so: such as Saarbrücken, Deux Ponts (Zweibrücken) and Montbéliard in the Rhineland; Strasbourg and Casale in 1661. The power of the house of Habsburg was paralysed by an invasion of the Netherlands: Louis XIV. sent 35,000 men into Belgium; while Wallenstein was occupied by Créqui and Vauban. The truce of Ratisbon (Regensburg) imposed upon Spain completed the work of the peace of Nijmegen (1668); and thenceforward Louis XIV.’s terrified allies avoided his clutches while making ready to fight him.

This was the moment chosen by Louis XIV.’s implacable enemy, William of Orange, to resume the war. His surprise of Marshal Luxembourg near Mons, after the signature of the peace of Nijmegen, had proved that in his eyes war was the basis of his authority in Holland and Europe. His sole arm of support amidst all his allies was not the English monarchy, sold to Louis XIV., but Protestant England, jealous of France and uneasy about her independence. Being the husband of the duke of York’s daughter, he had an understanding in this country with Sunderland, Godolphin and Temple—a party whose success was retarded for several years by the intrigues of Shaftesbury. But Louis XIV. added mistake to mistake; and the revocation of the edict of Nantes added religious hatreds to political jealousies. At the same time the Catholic powers responded by the league of Augsburg (July 1686) to his policy of unlimited aggrandisement.

The unsuccessful attempts of Louis XIV. to force his partisan Cardinal Wilhelm Egon von Fürstenberg (sec. Fürstenberg: House) into the electoral see of Cologne; the bombardment of Genoa; the humiliation of the pope in Rome itself by the marquis de Lavardin; the seizure of the Huguenot emigrants at Mannheim, and their imprisonment at Vincennes under pretext of a plot, precipitated the conflict. The question of the succession in the Palatinate, where Louis XIV. supported the claims of his sister-in-law the Duchess of Orleans, gave the signal for a general war. The French armies devastated the Palatinate instead of attacking William of Orange in the Netherlands, leaving him free to disembark at Torbay, uspurn the throne of England, and construct the Grand Alliance of 1689.

But Louis XIV., reserving for himself the decisive for an important struggle elsewhere, foreshadowed by the approach of death of Charles H. of Spain, Louis XIV., isolated in his turn, committed the error of wasting it for a space of ten years in a war of conquest, by which he alienated all that remained to him of European sympathy. The French armies, notwithstanding the disappearance of Condé and Turenne, had still glorious days before them with Luxembourg at Fleurus, at Steenkirk and at Neerwinden (1690—1693), and with Caitin in Piedmont, at Staffarda, and at Marsaglia; but these successes alternated with reverses. Tourville’s fleet, victorious at Beachy Head, came to grief at La Hogue (1692); and though the expeditions to Ireland in favour of James II. were unsuccessful, thanks to the Huguenot Schomberg, Jean Bart and Duguay-
FRANCE

845

Troué ruined Anglo-Dutch maritime commerce. Louis XIV. assisted in person at the sieges of Mons and Namur, operations for which he had a liking, because, like Louis, who died in 1661, he thought little of the French soldiery in the open field. After three years of strife, ruinous to both sides, he made the first overtures of peace, thus marking an epoch in his foreign policy; though William took no unfair advantage of this, remaining content with the restitution of places taken by the Chambres de Réunion, except Strassburg, with a frontier-line of fortified places for the Dutch, and with the official deposition of the Stuarts. But the treaty of Ryswick (1697) marked the condemnation of the policy pursued since that of Nijmegen. While signing this peace Louis XIV. was only thinking of the succession in Spain. By partitioning her in advance with the other strong powers, England and Holland, by means of the treaties of the Hague and of London (1658-1660)—as he had formerly done with the emperor in 1668—he seemed at first to wish for a pacific solution of the eternal conflict between the Habsburgs and the Bourbons, and to restrict himself to the perfecting of his natural frontiers; but on the death of Charles II. of Spain (1700) he claimed everything in favour of his grandson, the duke of Anjou, now appointed universal heir, though risking the loss of all by once more letting himself fall into imprudent and provocative action in the dynastic interest.

English public opinion, desirous of peace, had forced William III. to recognize Philip V. of Spain; but Louis XIV.'s maintenance of the eventual right of his grandson to the crown of France, and the expulsion of the Dutch, who had not recognized Philip V., from the Barrier towns, brought about the Grand Alliance of 1701 between the maritime Powers and the court of Vienna, desirous of partitioning the inheritance of Charles II. The recognition of the Old Pretender as James III., king of England, was only a response to the Grand Alliance, but it drew the English Tories into an inevitable war. Despite the death of William III. (March 1702) his policy triumphed, and in this war, the longest in the reign, it was the names of the enemy's generals, Prince Eugène of Savoy, Mazarin's grand-nephew, and the duke of Marlborough, which sounded in the ear, instead of Condé, Turenne and Luxembourg. Although during the first campaigns (1701-1703) in Italy, in Germany and in the Netherlands success was equally balanced, the successors of Villars—thanks to the treason of the duke of Savoy—were defeated at Hôchstädt and Landau, and were reduced to the defensive (1704). In 1706 the battles at Ramillies and Turin led to the evacuation of the Netherlands and Italy, and endangered the safety of Dampierre. In 1708 Louis XIV. by a supreme effort was still able to maintain his armies; but the rout at Oudenarde, due to the misunderstanding between the duke of Burgundy and Vendôme, left the northern frontier exposed, and the canons of the Dutch were heard at Marly. Louis XIV. had to humble himself to the extent of asking the Dutch for peace; but they forgot the lesson of 1673, and revolted by their demands an appeal to the patriotism of his subjects at Malplaquet (September 1709). After this came invasion. Nature herself conspired with the enemy in the disastrous winter of 1709.

What saved Louis XIV. was not merely his noble constancy of resolve, the firmness of the marquis de Torsy, secretary of state for foreign affairs, the victory of Vendôme at Villaviciosa, nor the loyalty of his people. The interruption of the conferences at Gertruydenberg having obliged the Whigs and Marlborough to resign their power into the hands of the Tories, now sick of war, the death of the emperor Joseph I. (April 1711), which risked the reconstruction of Charles V.'s colossal and unwieldy monarchy upon the shoulders of the archduke Charles, and Marshall Villars' famous victory of Denain (July 1712) combined to render possible the treaties of Utrecht, Rastatt and Baden (1713-1714). These gave Italy and the Netherlands to the Habsburgs, Spain and her colonies to the Bourbons, the places on the coast and the colonial commerce to England (who had the lion's share), and a royal crown to the duke of Savoy and the elector of Brandenburg. The peace of Utrecht was to France what the peace of Westphalia had been to Austria, and curtailed the former acquisitions of Louis XIV.

The ageing of the great king was betrayed not only by the fortune of war in the hands of Villeroi, la Feuillade, or Marsin; disgrace and misery at home were worse than defeat. By the strange and successive deaths of the Grand Dauphin (1711), the duke and duchess of Burgundy (1712)—who had been the only joy of the old monarch—and of his two grandsons (1712-1714), it seemed as though his whole family were involved under the same curse. The court, whose sentimental history has been related by Madame de la Fayette, its official splendours by Loret, and its intrigues by the duc de Saint-Simon, now resembled an infirmity of morose invalids, presided over by Louis XIV.'s elderly wife, Madame de Maintenon, under the domination of the Jesuit le Teller. Neither was it merely the clamours of the people that arose against the monarch. All the more remarkable spirits of the time, like prophets in Israel, denounced a tyranny which put Chamillart at the head of the finances because he played billiards well, and Villeroi in command of the armies although he was purely untrustworthy; which sent the "patriot" Vauban into disgrace, banished from the court Catinat, the Père la Pensée, "exiled" to Cambrai the too clear sighted Fénélon, and suspected Racine of Jansenism and La Fontaine of independence.

Disease and famine; crushing imposts and exactions; official debasement of the currency; bankruptcy; state prisons; religious and political inquisition; suppression of all institutions for the safe-guarding of rights; tyranny by the intendants; royal, feudal and clerical oppression burdening every faculty and every necessary of life; "monstrous and incurable luxury"; the horrible drama of poison; the twofold adultery of Madame de Montespan; and the narrow bigotry of Madame de Maintenon—all concurred to make the end of the reign a sad contrast with the splendour of its beginning. When reading Molière and Racine, Bossuet and Fénélon, the campaigns of Turenne, or Colbert's ordinances; when enumerating the countless literary and scientific institutions of the great century; when considering the port of Brest, the Canal du Midi, Perrault's colonnade of the Louvre, Mansart's Invalides and the palace of Versailles, and Vauban's fine fortifications—adoration is kindled for the radiant splendour of Louis XIV.'s period. But the art and literature expressed by the genius of the masters, reflected in the tastes of society, and to be taken by Europe as a model throughout a whole century, are no criterion of the social and political order of the day. They were but a magnificent drapery of pomp and glory thrown across a background of poverty, ignorance, superstition, hypocrisy and cruelty; remove it, and reality appears in all its brutal and sinister nudity. The corpse of Louis XIV., left to servants for disposal, and saluted all along the road to Saint Denis by the curses of a noisy crowd sitting in the cabarets, celebrating his death by drinking more than their fill as a compensation for having suffered too much from hunger during his lifetime; what was the coarse but sincere epitaph, which popular fancy placed on the tomb of "the Grand Monarch"—the nation, restive under his now broken yoke, received with a joyous anticipation, which the future was to disappoint, the royal infant whom they called Louis the Well-beloved, and whose funeral sixty years later was to be greeted with the same proofs of disillusionment.

The death of Louis XIV. closed a great era of French history; the 18th century opens upon a crisis for the monarchy. From 1715 to 1723 came the reaction of the Regency, with its marvellous effrontery, innovating spirit and frivolous immorality. From 1723 to 1743 came the mealy-mouthed despotism of Cardinal Fleury, and his apathetic policy within and without the kingdom. From 1743 to 1774 came the personal rule of Louis XV., when all the different powers were in conflict—the bishops and parlement quarrelling, the government fighting against the clergy and the magistracy, and public opinion in declared opposition to the state. Till at last, from 1774 to 1789, came Louis XVI. with his bonnet illusions.
his moral pusillanimity and his intellectual impotence, to aggravate still further the accumulated errors of ages and to purgation for the inevitable Revolution.

The 18th century, like the 17th, opened with a political coup d'état. Louis XV., was five years old, and the duchy of Orleans held the regency. But Louis XIV. had in his will delegated all the power of the government to a council on which the duke of Maine, his legitimated son, had the first, but Madame de Maintenon and the Jesuits the predominant place. This collective administration, designed to cripple the action of the regent, encountered a twofold opposition from the nobles and the parlement; but on the 2nd of September 1715 the emancipated parliment set aside the will in favour of the duke of Orleans, who thus together with the title of regent had all the real power. He therefore re instituted the parliment in its ancient right of remonstrance (suspended since the declarations of 1667 and 1675), and handed over ministerial power to the nobility, replacing the secretaries of state by six councils composed in part of great nobles, on the advice of the famous duc de Saint-Simon. The duc de Noailles, president of the new council of finance, had the direction of this "Polysynodie." The duke of Orleans, son of the princess palatine and Louis XIV.'s brother, possessed many gifts—courage, intelligence and agility of mind—but he lacked the one gift of using these to good advantage. The political crisis that had placed him in power had not put an end to the financial crisis, and this, it was hoped, might be effected by substituting partial and petty bankruptcies for the general bankruptcy cynically advocated by Saint-Simon. The reduction of the royal revenues did not suffice to fill the treasury; whilst the establishment of a chamber of justice (March 1716) had no other result than that of demoralizing the great lords and ladies already mad for pleasure, by bringing them into contact with the farmers of the revenue who purchased impunity from them. A very clever Scotch adventurer named John Law (q.v.) now offered his assistance in dealing with the enormouse debt of more than three milliards, and in providing the treasury. Being well acquainted with the mechanism of banking, he had adjusted views as to cash, credit and the circulation of values which contained an admixture of truth and falsehood. Authorized after many difficulties to organize a private bank of deposit and account, which being well conceived prospered and revived commerce, Law proposed to lighten the treasury by the profits accruing to a great maritime and colonial company. Payment for the shares in this new Company of the West, with a capital of a hundred millions, was to be made in credit notes upon the government, converted into 4% stock. These aggregated funds, needed to supply the immense and fertile valley of the Mississippi, and the annuities of the treasury destined to pay for the shares, were non-transferable. Law's idea was to ask the bank for the floating capital necessary, so that the bank and the Company of the West were to be supplementary to each other; this was what was called Law's system. After the chancellor D'Aguessseau and the duc de Noailles had been replaced by D'Argenson alone, and after the loi de justice of the 26th of August 1718 had deprived the parlement, hostile to Law, of the authority left to it, the bank became royal and the Company of the West universal. But the royal bank, as a state establishment, asked for compulsory privilege to increase the emission of its credit notes, and that they should receive a premium upon all metallic specie. The company of the Indies became the grantee for the farming of tobacco, the coinage of metals, and farming in general; and in order to procure funds it multipled the output of shares, which were adroitly launched and became more and more sought for on the exchange in the rue Quincampoix. This soon caused a frenzy of stock-jobbing, which disturbed the stability of private fortunes and social positions, and depraved customs and manners with the seductive notion of easily obtained riches. The nomination of Law to the controller-generalship, re-established for his benefit on the resignation of D'Argenson (January 5, 1720), let loose still wilder speculation; till the day came when he could no longer face the terrible difficulty of meeting both private irredeemable shares with a variable return, and the credit notes redeemable at sight and guaranteed by the state. Gold and silver were proscribed; the bank and the company were joined in one; the credit notes and the shares were assimilated. But credit cannot be commanded either by violence or by expedients; between July and September 1720 came the suspension of payments, the flight of Law, and the disastrous liquidation which proved once again that respect for the state's obligations had not yet entered into the law of public finance.

Reaction on a no less extensive scale characterized foreign policy during the Regency. A close alliance between France and her ancient enemies, England and Holland, was concluded and maintained from 1717 to 1739: France, after thirty years of fighting, between two periods of bankruptcy; Holland reinstated in her commercial position; and England, seeing before her the beginning of her empire over the seas—all three had an interest in peace. On the other hand, peace was imperilled by Philip V. of Spain and by the emperor (who had accepted the portion assigned to him by the treaty of Utrecht, while claiming a whole of Portugal and Brandenburg (who had profited too much by European conflicts not to desire their perpetuation), by the crisis from which the maritime powers of the Baltic were suffering, and by the Turks on the Danube. The dream of Cardinal Alberoni, Philip V.'s minister, was to set fire to all this inflammable material in order to snatch therewith a crown of some sort to satisfy the maternal greed of Elizabeth Farnese; and this he might have attained by the occupation of Sardinia and the expedition to Sicily (1717-1718), if Dubois, a priest without a religion, a greedy parvenu and a diplomatist of second rank, though tenacious and full of resources as a minister, had not placed his common sense at the disposal of the regent's interests and those of European peace. He signed the triple alliance at the Hague, succeeding with the assistance of Stanhope, the English minister, in engaging the emperor therein, after attempting this for a year and a half. Whilst the Spanish fleet was destroyed before Syracuse by Admiral Byng, the intrigue of the Spanish ambassador Cellamare with the duke of Maine to exclude the family of Orleans from the succession on Louis XV.'s death was discovered and repressed; and Marshal Berwick burned the dockyards at Pasajes in Spain. Alberoni's dream was shattered by the treaty of London in 1720.

Seized in his turn with a longing for the cardinal's hat, Dubois paid for it by the registering of the bull Unigenitus and by the persecution of the Jansenists which the regent had stopped. After the majority of Louis XV. had been proclaimed on the 16th of February 1723, Dubois was the first to depart; and four months after his disappearance the duke of Orleans, exhausted by his excesses, carried with him into the grave that spirit of reform which he had compromised by his frivolous voluptuousness (December 2, 1723).

The Regency had been the making of the house of Orleans; thenceforward the question was how to humble it, and the duc d'Argenson, who was now minister—a great-grandson of the great Condé, but a man of narrow views, with limited intelligence, led by a worthless woman—set himself to do so. The marquis de Prie was the first of a series of publicly recognized mistresses; from 1723 to 1726 she directed foreign policy and internal affairs despite the king's majority, moved always more by a spirit of vengeance than by ambition. This sad pair were dominated by the self-interested and continual fear of becoming subject to the son of the Regent, whom they detested; but danger came upon them from elsewhere. They found standing in their way the very man who had been the author of their fortunes, Louis XV.'s tutor, uneasy in the exercise of a vailed authority; for the churchman Fleury knew how to wait, on condition of ultimately attaining his end. Neither the festivities given at Chantilly in honour of the king, nor the dismissal (despite the most solemn promises) of the Spanish infanta, who had been betrothed
to Louis XV., nor yet the young king's marriage to Maria Leszczynska (1723)—a marriage negotiated by the marquise de Peire in order to bar the throne from the Orleans family—could alienate the sovereign from his old master. The irritation kept up by the agents of Philip V., incensed by this affront, and the discontent aroused by the institutions of the vingtième and the militia, by the re-establishment of the feudal tax on Louis XV.'s joyful accession, and by the resumption of a persecution of the Protestants and the Jansenists which had apparently died out, were cleverly exploited by Fleury; and a last ill-timed attempt by the queen to separate the king from him brought about the fall of the duc de Bourbon, very opportunely for France, in June 1726.

From the hands of his unhinging pupil Fleury eventually received the supreme direction of affairs, which he retained for seventeen years. He was aged seventy-two when he thus obtained the power which had been his unmeasured though not ill-calculated ambition. Soft-spoken and polite, crafty and suspicious, he was pacified by temperance and therefore allowed politicians to slumber. His turn for economics made Orry, the controller-general of finance, for long his essential partner. The latter laboured at re-establishing order in fiscal affairs; and various measures like the impost of the dixième upon all property save that of the clergy, together with the end of the corn famine, sufficed to restore a certain amount of well-being. Religious peace was more difficult to secure; in fact politico-religious quarrels dominated all the internal policy of the kingdom during forty years, and gradually compromised the royal authority. The Jesuits, returned to power in 1723 with the duc de Bourbon and in 1726 with Fleury, rekindled the old strife regarding the bull Unigenitus in opposition to the Gallicans and the Jansenists. The retraction imposed upon Cardinal de Noailles, and his replacement in the archbishopric of Paris by Vintimille, an unequivocal Molinist, excited among the populace a very violent agitation against the court of Rome and the Jesuits, the pretender to a united Fronde of the Sorbonne and the parlement. Fleury found no other remedy for this agitation—in which appeal was made even to miracles—than lits de justice and lettres de cachet; Jansenism remained a potent source of trouble within the heart of Catholicism. This worn-out septuagenarian, who prized rest above everything, imported into foreign policy the same mania for economy and the same sloth in action. He naturally adopted the idea of reconciling Louis XIV.'s descendants, who had all been ennobled ever since the Polish marriage. He succeeded in this by playing very adroitly on the ambition of Elizabeth Farnese and her husband Philip V., who was to reign in France notwithstanding any renunciation that might have taken place. Despite the birth of a dauphin (September 1729), which cut short the Spanish intrigues, the reconciliation was a lasting one (treaty of Seville); it led to common action in Italy, and to the installation of Spanish royalties at Parma, Placentia, and soon after at Naples. Fleury, supported by the English Hanoverian alliance, to which he sacrificed the French navy, obliged the emperor Charles VI. to sacrifice the trade of the Austrian Netherlands to the maritime powers and Central Italy to the Bourbons, in order to gain recognition for his Pragmatic Sanction. The question of the succession in France lay dormant until the end of the century, and Fleury thought he had definitely obtained peace in the treaty of Vienna (1731).

The war of the Polish succession proved him to have been deceived. On the death of Augustus II. of Saxony, king of Poland, Louis XV.'s father-in-law had been proclaimed king by the Polish diet. This was an ephemeral success, ill-prepared and obtained by taking a sudden advantage of national sentiment; it was soon followed by a check, owing to a Russian and German coalition and the baseness of Cardinal Fleury, who, in order to avoid intervening, pretended to tremble before an imaginary threat of regiment on the part of England. But Chauvelin, the keeper of the seals, supported by public opinion, avenged on the Rhine and the Po the unlucky heroism of the comte de Plélo at Danzig, the vanished dream of the queen, the broken word of Louis XV., and the treacherous abandonment of Poland. Fleury never forgave him for this: Chauvelin had checkmated him with war; he checkmated Chauvelin with peace, and hastened to replace Marshals Berwick and Villars by diplomats. The third treaty of Vienna (1738), the reward of so much effort, would only have claimed for France the little duchy of Bar, had not Chauvelin forced Louis XV. to obtain Lorraine for his father-in-law—still hoping for the reversion of the crown; but Fleury thus rendered impossible any influence of the queen, and held Stanislaus at his mercy. In order to avenge himself upon Chauvelin he sacrificed him to the cabinets of Vienna and London, alarmed at seeing him revive the national tradition in Italy.

Fleury hardly had time to breathe before a new conflagration broke out in the east. The Russian empress Anne and the emperor Charles VI. had planned to begin the liquidation of the Austrian empire. More fortunate than Plélo, Villeneuve, the French ambassador at Constantinople, endeavoured to postpone this event, and was well supported; he revived the courage of the Turks and provided them with arms, thanks to the comte de Bonneval (q.v.), one of those adventurers of high renown whose influence in Europe during the first half of the eighteenth century is one of the most piquant features of that period. The peace of Belgrade (September 1739) was, by its renewal of the capitulations, a great material success for France, and a great moral victory by the rebuff to Austria and Russia.

France had become once more the arbiter of Europe, when the death of the emperor Charles VI. in 1740 opened up a new period of wars and misfortunes for Europe and for the Pacific Fleury. Everyone had signed Charles VI.'s Austrian Sanction, sanctioning the succession-rights of his daughter, the archduchess Maria Theresa; but on his death there was a general renunciation of signatures and an attempt to divide the heritage. The safety of the house of Austria depended on the attitude of France; for Austria could no longer harm her. Fleury's inclination was not to misuse France's traditional policy by exaggerating it, but to respect his sworn word; he dared not press his opinion, however, and yielded to the fiery impatience of young hot-heads like the two Belle-Isles, and of all those who, infatuated by Frederick II., felt sick of doing nothing at Versailles and were backed up by Louis XV.'s bellicose mistresses. He had to experience the repeated defections of Frederick II. in his own interests, and the precipitate retreat from Bohemia. He had to humble himself before Austria and the whole of Europe; and it was high time for Fleury, now fallen into second childhood, to vanish from the scene (January 1743).

Louis XV. was at last in a position to dismiss his own prime minister and to reign alone; but in reality he was more embarrassed than pleased by the responsibility incumbent upon him. He therefore retained the persons who had composed Fleury's staff; though instead of being led by a single one of them, he fell into the hands of several, who disputed among themselves for the ascendency: Maurepas, incomparable in little things, but neglectful of political affairs; D'Argenson, bold, and strongly attached to his work as minister

1 Jean Orry Louis Orsy de Fulvy (1703-1751), counsel to the parlement in 1723, intendant of finances in 1737, founded at Vincennes the manufacture of porcelain which was bought in 1750 by the farmers general and transferred to Sèvres.

2 Louis Robert Hippolyte de Bréhan, comte de Plélo (1699-1734), a Breton by birth, originally a soldier, was at the time of the siege of Danzig French ambassador to Denmark. Enraged at the return to Copenhagen, without having done anything, of the French force sent to help Stanislaus, he fled back to Danzig and fell an attack on the Russians on the 27th of May 1734. Plélo was a poet of considerable charm, and well-read both in science and literature.

See Marquis de Bréhan, Le Comte de Plélo (Paris, 1876); and P. Boyle, Stanislaus Leszcynski et le troisième traité de Vienne (Paris, 1889).
of war; and the cardinal de Tencin, a frivolous and worldly priest. Old Marshal de Noailles tried to incite Louis XV. to take his kingship in earnest, thinking to cure him by war of his effeminate passions; and, in the spring of 1744, the king's grave illness at Metz gave a momentary hope of reconciliation between him and the deserted queen. But the duc de Richelieu, a roué who had joined hands with the sisters of the house of Nesle and was jealous of Marshal de Noailles, soon regained his lost ground; and, under the influence of this panederer to his pleasures, Louis XV. settled down into a life of vice. Holding aloof from active affairs, he tried to relieve the incurable boredom of satiety in the violent exercise of hunting, in supper-parties with his intimates, and in spicy indiscretions. Brought up religiously and to shun the society of women, his first experiences in adultery had been made with many scruples and intermittently. Little by little, however, jealous of power, yet incapable of exercising it to any purpose, he sank into a sensuality which became utterly shameless under the influence of his chief mistreesse the duchesse de Châteauroux.

Hardly had a catastrophe snatched her away in the zenith of her power when complete corruption and the flagrant triumph of vice egotism supervised with the accession of his secret Pompadour. The king, under the influence of Madame de Pompadour, for nearly twenty years (1745-1764) the whims and caprices of this little bourgeoise ruled the realm. A prime minister in petticoats, she had her political system: reversed the time-honoured alliances of France appointed or disgraced ministers, directed fleets and armies, concluded treaties, and failed in all her enterprises! She was the queen of fashion in a society where corruption blossomed luxuriantly and exquisitely, and in a century of wit hers was second to none. Amidst this extraordinary instability, when everything was at the mercy of a secret thought of the master, the mistress alone held lasting sway; in a reign of all-pervading satiety and tedium, she managed to remain indispensable and bewitching to the day of her death.

Meanwhile the War of the Austrian Succession broke out again, and never had secretary of state more intricate to solve than had D'Argenson. In the attempt to make a stage-emperor of Charles Albert of Bavaria, defeat was incurred at Dettingen, and the French king was driven back on the Rhine (1743). The Bavarian dream dissipated, victories gained in Flanders by Marshal Saxe, another adventurer of genius, at Fontenoy, Raucoux and Lawfield (1745-1747), were hailed with joy as continuing those of Louis XIV.; even though they resulted in the loss of Germany and the doubling of English armaments. The “disinterested” peace of Aix-la-Chapelle (October 1748) had no effectual result other than that of destroying in Germany, and for the benefit of Prussia, a balance of power that had yet to be secured in Italy, despite the establishment of the Spanish prince Philip at Parma. France, meanwhile, was beaten at sea by England, Maria Theresa's sole ally. While founding her colonial empire England had come into collision with France; and the rivalry of the Hundred Years' War had immediately sprung up again between the two countries. Engaged already in both Canada and in Asia (where Dupleix was founding an empire with a mere handful of men), it was to France's interest not to become involved in war upon the Rhine, thus falling into England's continental trap. She did fall into it, however: for the sake of conquering the king of Prussia, and the French king by the capture of Cape Breton; while in order to restore this same Silesia to Maria Theresa, Canada was lost and with it India.

France had worked for the king of Prussia from 1740 to 1748; now it was Maria Theresa's game that was played in the Seven Years' War. In 1755, the English having made a sudden attack upon the French at sea, and Frederick II. having by a fresh volte-face passed into alliance with Great Britain, Louis XV.'s government accepted an alliance with Maria Theresa in the treaty of the 1st of May 1756. Instead of remaining upon the defensive in this continental war—merely accessory as it was—he made it his chief affair, and placed himself under the petticoat government of three women, Maria Theresa, Elizabeth of Russia and the marquise de Pompadour. This error—the worst of all—bade the foundations of the Prussian and British empires. By three battles, victories for the enemies of France—Rossbach in Germany, 1757, Plassey in India, 1757, and Quebec in Canada, 1759 (owing to the recall of Dupleix, who was not bringing in large enough dividends to the Company of the Indies, and to the abandonment of Montcalm, who could not interest any one in "a few acres of snow"), the expansion of Prussia was assured, and the British relieved of French rivalry in the expansion of their empire in India and on the North American continent.

Owing to the blindness of Louis XV. and the vanity of the favourite, the treaties of Paris and Hubertusburg (1763) once more proved the French splendid in their conceptions, but deficient in action. Moreover, Choiseul, secretary of state for foreign affairs since 1758, made out of this deceptive Austrian alliance a system which put the finishing touch to disaster; and after having thrown away everything to satisfy Maria Theresa's hatred of Frederick II., the reconciliation between these two irreconcilable powers at Hubertusburg (1766-1770) was witnessed by France, to the prejudice of Poland.

The expeditent of the Family Compact, concluded with Spain in 1761—with a view to taking vengeance upon England, whose fleets were a continual thorn in the side to France—served only to involve Spain herself in misfortune. Choiseul, who at least had a policy that was sometimes in the right, and who was very anxious to carry it out, then realized that the real quarrel had been settled with England. Amid the anguish of defeat and of approaching ruin, he had an acute sense of the actualities of the case, and from 1763 to 1766 devoted himself passionately to the reconstruction of the navy. To compensate for the loss of the colonies he annexed Lorraine (1766), and by the acquisition of Corsica in 1768 he gave France an intermediary position in the Mediterranean, between friendly Spain and Italy, looking forward to the time when it should become a stepping-stone to Africa.

But Louis XV. had two policies. The incoherent efforts which he made to repair by the secret diplomacy of the comte d'Aiguillon the evil caused by his official policy only aggravated his shortcomings, and his blindness. The contradictory intrigues of the king's secret proceedings in the candidature of Prince Xavier, the dauphin's brother, and the patriotic efforts of the confederation of Bar, contributed to bring about the Polish crisis which the partition of 1772 resolved in favour of Frederick II.; and the Turks were in their turn dragged into the same disastrous affair. Of the old allies of France, Choiseul preserved at least Sweden by the coup d'etat of Gustavus III.; but instead of being as formerly the centre of great affairs, the cabinet of Versailles lost all its credit, and only exhibited before the eyes of contemptuous Europe France's extreme state of decay.

The nation felt this humiliation, and showed all the greater irritation as the want of cohesion in the government and the anarchy in the central authority became more and more intolerable in home affairs. Though the administration still possessed a fund of tradition and a personnel which, including many men of note, protected it from the enfeebling influence of the court, it looked as though the intrigues of the king and the part of the government concerned. These fluctuations were owing to the personal character of Louis XV., and partly also to the fact that society in the 18th century was too advanced in its ideas to submit without resistance to the caprice of such a man. His mistresses were not the only cause of this; for ever since Fleury's advent political parties had come to the fore. From 1749 to 1757 the party of religious devotees grouped round the queen and the king's daughters, with the dauphin as chief and the comte D'Argenson, and Machault d'Arnouville, keeper of the seals, as lieutenants, had worked against Madame de Pompadour (who longed for support upon the parlements, the Jansenists and the philosophers)
and had gained the upper hand. Thenceforward poverty, disorders, and consequently murmurs increased. The financial reform attempted by Machault d'Arnouville between 1715 and 1740—a reduction of the debt through the impost of the twentieth and the edict of 1740 against the extensive property held in mortmain by the Church—after his disgrace only resulted in failure. The army, which D'Argenson (likewise dismissed by Madame de Pompadour) had been from 1743 to 1747 trying to restore by useful reforms, was riddled by cabals. Half the people in the kingdom were dying of hunger, while the court was insulting poverty by its luxury and waste; and from 1750 onwards political ferment was everywhere manifest. It found all the more favourable foothold in that the Church, the State's best ally, had made herself more and more unpopular. Her refusal of the sacraments to those who would not accept the bull Unigenitus (1746) was exploited in the eyes of the masses, as in those of more enlightened people was her selfish and short-sighted resistance to the financial plans of Machault.

The general discontent was expressed by the parlements in their attempt to establish a political supremacy amid universal confusion, and by the popular voice in pamphlets recounting how they discredited those of the League. Every one expected and desired a speedy revolution that should put an end to a policy which alternated between overheated effervescence, abnormal activity and lethargy. Nothing can better show the point to which things had descended than the attempted assassination of Louis the Well-beloved by Damiens in 1757.

Choiseul was the means of accelerating this revolution, not only by his abandonment of diplomatic traditions, but still more by his impudence and violence. He reversed the policy of his predecessors in regard to the parliament. Supported by public opinion, which clamoured for guarantees against arbitrary power, the parlements had dared not only to insist on being consulted as to the budget of the state in 1763, but to enter upon a confederation throughout the whole of France, and on repeated occasions to ordain a general strike of the judicial authorities. Choiseul did not hesitate to attack through lits de justice or by exile a judiciary oligarchy which doubtless hastened its pretensions merely on wealth, high birth, or that encroaching spirit that was the only counteracting agency to the monarchy. Louis XV., wearied with their clamour, called them to order. Choiseul's religious policy was no less venturesome; after the condemnation in 1759 of the Jesuits who were involved in the bankruptcy of Father de la Valette, their general, in the Antilles, he had the order dissolved for refusing to modify its constitution (1761-1764). Thus, not content with encouraging writers with innovating ideas to the prejudice of traditional institutions, he attacked, in the order of the Jesuits, the strongest defender of these latter, and delivered over the new generation to revolutionary doctrines.

A woman had elevated him into power; a woman brought him to the ground. He succumbed to a coalition of the chancellors Maupoue, the duc d'Aiguillon and the Abbé Terray, which depended on the favour of the latter's latest mistress, Madame du Barry (December 1770); and the Jesuits, with the Count Maurepas, who struck at authority similar to that by which they themselves had suffered. Following on an edict registered by the lit de justice, which forbade any remonstrance in political matters, the parlement had resigned, and had been suppressed by the provincial parlements; whereupon Maupoue, an energetic chancellor, suppressed the parlements and substituted superior councils of magistrates appointed by the king (1771). This reform was justified by the religious intolerance of the parlements; by their scandalous trials of Calas, Pierre Paul Sirven (1700-1777), the chevalier de la Barre and the comte de Lally; by the retrograde spirit that had made them suppress the Encyclopædia in 1759 and condemn Émile in 1762; and by their selfishness in perpetrating abuses by which they profited. But this reform, being made by the minister of a hated sovereign, only aided in exasperating public opinion, which was grateful to the parlements in that their remonstrances had not always been fruitless.

Thus all the butresses of the monarchical institution began to fall to pieces: the Church, undermined by the heresy of Jansenism, weakened by the inroads of philosophy, disgraced by evil-livers among the priesthood, and divided against itself, like all losing parties; the nobility of the court, still brave at heart, though incapable of exertion and reduced to begging, having lost all respect for discipline and authority, not only in the camp, but in civilian society; and the upper-class officials, narrow-minded and egotistical, unsettling by their opposition the royal authority which they pretended to safeguard. Even the “liberties,” among the few representative institutions which the ancien régime had left intact in some provinces, turned against the people. The estates opposed most of the intelligent and humane measures proposed by such intendants as Tourny and Turgot to relieve the peasants, whose distress was very great; they did their utmost to render the selfishness of the privileged classes more oppressive and vexatious.

The terrible prevalence of poverty and want; the successive famines; the mistakes of the government; the sedition of the Parc aux Fees; and the parliamentaries playing the Roman senate: all these, united, vied with each other, and brought together and multiplied, assisted in setting a general fermentation to work. The philosophers only helped to precipitate a movement which they had not created; without pointing to absolute power as the cause of the trouble, and without pretending to upset the traditional system, they attempted to instil into princes the feeling of new and more precise obligations towards their subjects. Voltaire, Montesquieu, the Encyclopédistes and the Physiocrats (recurring to the tradition of Bayle and Fontenelle), by dissolving in their analytical crucible all consecrated beliefs and all fixed institutions, brought back into the human society of the 18th century that humanity which had been so rudely eliminated. They demanded freedom of thought and belief with passionate insistence; they ardently discussed institutions and conduct; and they imported into polemics the idea of natural rights superior to all political arrangements. Whilst some, like Voltaire and the Physiocrats, representatives of the privileged classes and careless of political rights, wished to make use of the omnipotence of the prince to accomplish desirable reforms, or, like Montesquieu, severely criticized despotism and extolled moderate governments, other, plebeians like Rousseau, proclaimed the theory of the social contract and the sovereignty of the people. So that during this reign of frivolity and passion, so bold in conception and so poor in execution, the thinkers contributed still further to mark the contrast between grandeur of plan and mediocrity of result.

The preaching of all this generous philosophy, not only in France, but throughout the whole of Europe, would have been in vain had there not existed at the time a social class interested in these great changes, and capable of compassing them. Neither the witty and lucid form in which the philosophers clothed their ideas in their satires, romances, stage-plays and treatises, nor the salons of Madame du Deffand, Madame Geoffrin and Mademoiselle de Lespinasse, could possibly have been sufficiently far-reaching or active centres of political propaganda. The former touched only the highly educated classes; while to the latter, where privileged individuals alone had entry, novelties were but an undiluted stimulant for the jaded appetites of persons whose ideas of good-breeding, moreover, would have drawn the line at martyrdom.

The class which gave the Revolution its chiefs, its outward and visible forms, and the irresistible energy of its hopes, was the bourgeoisie, intelligent, ambitious and rich; in the forefront the capitalists and financiers of the haute bourgeoisie, farmers-general and army contractors, who had supplanted or swamped the old landed and military aristocracy, had insensibly reconstructed the interior of the ancient social edifice with the gilded and incongruous materials of wealth, and in order to consolidate or increase their monopolies, needed to secure themselves against the arbitrary action of wealth and the bureaucracy.
Next came the crowd of stockholders and creditors of the state, who, in face of the government's "extravagant anarchy," no longer felt safe from partial or total bankruptcy. More powerful still, and more masterful, was the commercial, industrial and colonial bourgeoisie; because under the Regency and under Louis XV. they had been more productive and more creative. Having gradually revolutionized the whole economic system, in Paris, in Lyons, in Nantes, in Bordeaux, in Marseilles, they could not tamely put up with being excluded from public affairs, which had so much bearing upon their private or collective enterprises. Finally, behind this bourgeoisie, and afar off, came the crowd of serfs, rustics whom the acquisition of land had gradually enfranchised, and who were the more eager to enjoy their definitive liberation because it was close at hand.

The habits and sentiments of French society showed similar changes. From having been almost exclusively national during Louis XIV.'s reign, owing to the perpetual state of war and to a sort of proud isolation, it had gradually become cosmopolitan. After the peace of Aix-la-Chapelle, France had been flooded from all quarters of the civilized world, but especially from England, by a concourse of foreign vices and vices, and often with her virtues and her universal language, whom she had received sympathetically. Paris became the brain of Europe. This revolution in manners and customs, coinciding with the revolution in ideas, led in its turn to a transformation in feeling, and to new aesthetic needs. Gradually people became sick of openly avowed gallantry, of shameless libertinism, of moral obliquity and of the flattering artifices of vice; a long shudder ran through the selfish torpor of the social body. After reading the Nouvelle-Hêlène, Clarissa and Sir Charles Grandison, fatigued and wearied society revived as though beneath the fresh breezes of dawn. The principle of examination, the reasoned analysis of human conditions and the discussion of causes, far from culminating in disillusioned nihilism, everywhere aroused the democratic spirit, the life of sentiment and of human feeling: in the drama, with Marivaux, Diderot and La Chaussee; in art, with Chardin and Greuze; and in the salons, in view of the suppression of privilege. So that to Louis XV.'s cynical and hopeless declaration: "Après moi déguê," the setting 18th century reigned which well acquainted in practice and an appeal to the future. A long-drawn echo from all classes hailed a revolution that was possible because it was necessary.

If this revolution did not burst forth sooner, in the actual lifetime of Louis XV., if in Louis XVI.'s reign there was a renewal of loyalty to the king, before the appeal to liberty was made, that is to be explained by this hope of recovery. But Louis XVI.'s reign (1774-1792) was only to be a temporary halting-place, an artifice of history for passing through the transition period whilst elaborating the transformation which was to revolutionize, together with France, the whole world.

Louis XVI. was twenty years of age. Physically he was stout, and a slave to the Bourbon fondness for good living; intellectually a poor creature but ill-educated, he loved nothing so much as hunting and locksmith's work. He had a taste for puerile amusements, a mania for useless little domestic economies in a court where millions vanished like smoke, and a natural idleness which achieved as its masterpiece the keeping a diary from 1766 to 1792 of a life so trivial which was yet but a foolish chronicle of fiddles. Add to this that he was a virtuous husband, a kind father, a fervent Christian and a good-natured man full of excellent intentions, yet a spectacle of moral pusillanimity and ineptitude.

From 1770 onwards lived side by side with this king, rather than at his side, the archduchess Marie Antoinette of Austria—one of the very graceful and very frivolous women who were to be found at Versailles, opening to life like the flowers she so much loved, enamoured of pleasure and luxury, delighting to free herself from the formalities of court life, and mingling in the amusements of society; lovely and loving, without ceasing to be virtuous. Flattered and adored at the outset, she very soon furnished a sinister illustration to Beaumarchais' Bastile; for evil tongues began to calumniate the queen: those of her brothers-in-law, the duc d'Aiguillon (protector of Madame du Barry and dismissed from the ministry), and the Cardinal de Rohan, recalled from his embassy in Vienna. She was blamed for her friendship with the comtesse de Polignac, who loved her only as the dispenser of titles and positions; and when weary of this persistent begging for rewards, she was taxed with her preference for foreigners who asked nothing. People brought up against her the debts and expenditure due to her belief in the inexhaustible resources of France; and hatred became definite when she was suspected of trying to imitate her mother Maria Theresa and play the part of ruler, since her husband neglected his duty. They then became persuaded that it was she who caused the weight of taxation; in the most infamous libels comparison was made between her freedom of behaviour and that of Louis XV.'s former mistresses. Private envy and public misconceptions very soon summed up her excessive unpopularity in the menacing nickname, "L'Autrichienne." (See Marie Antoinette.)

The balance of Louis XVI. was not a mind capable of directing or suppressing the inevitable revolution. His reign was but a tissue of contradictions. External affairs seemed in even a more dangerous position than those at home. Louis XVI. confided to Vergennes the charge of reverting to the traditions of the crown and raising France from the humiliation suffered by the treaty of Paris and the partition of Poland. His first act was to release French policy from the Austrian alliance of 1756; in this he was aided both by public opinion and by the confidence of the king—the latter managing to set aside the desires of the queen, whom the ambition of Maria Theresa and Joseph II. hoped to use as an auxiliary. Vergennes' object was a double one: to free the kingdom from English supremacy and to shake off the yoke of Austria. Opportunities offered themselves simultaneously. In 1775 the English colonies in America rebelled, and Louis XVI., after giving them secret aid and encouragement almost from the first, finally in February 1778, despite Marie Antoinette, formed an open alliance with them; while when Joseph II., after having partitioned Poland, wished to add the loss of Silesia with that of Bavaria, Vergennes prevented him from doing so. In vain was he offered a share in the partition of the Netherlands by way of an inducement. France's disinterested action in the peace of Teschen (1779) restored to her the lost adherence of the secondary states. Europe began to respect her again when she signed a Franco-Dutch-Spanish alliance (1779-1780), and when, after the capitulation of the English at Yorktown, the peace of Versailles (1783) crowned her efforts with at least formal success. Henceforward, partly from prudence and partly from penury, Vergennes cared only for the maintenance of peace—a not too easy task, in opposition to the greed of Catherine II. and Joseph II., who now wished to divide the Ottoman empire. Joseph II., recognizing that Louis XVI. would not sacrifice the "sick man" to him, raised the question of the opening of the Scheldt, against the Dutch. Vainly did Joseph II. accuse his sister of ingratitude and complain of her resistance; the treaty of Fontainebleau in 1785 maintained the rights of Holland. Later on, Joseph II., sticking to his point, wanted to settle the house of Bavaria in the Netherlands; but Louis XVI. supported the confederation of princes (Fürstenbund) which Frederick II. called together in order to keep his turbulent neighbour within bounds. Vergennes completed his work by signing a commercial treaty in 1786 with England, whose commerce and industry were favoured above others, and a second in 1787 with Russia. He died in 1787, at an opportune moment for himself; though he had temporarily raised France's position in Europe, his work was soon ruined by the very means taken to secure its successes: warfare and armaments had hastened the "hideous bankruptcy."

From the very beginning of his reign Louis XVI. fell into
Having fought the oligarchy of privilege, the monarchy next tried to rally it to its side, and all the springs of the old régime were strained to the breaking-point. The military rule of the marquis de Ségur eliminated the plebeians from the army; while the great lords, drones in the hive, worked with a kind of fever at the enforcement of their seignorial rights; the feudal system was making a last struggle before dying. The Church claimed her right of ordering the civil estate of all Frenchmen as an absolute mistress more strictly than ever. Joly de Fleury and D'Ormesson, Necker's successors, pushed their narrow spirit of reaction and the temerity of their inexperience to the furthest limit; but the reaction which reinforced the privileged classes was not sufficient to fill the coffers of the treasury, and Marie Antoinette, who seemed gifted with a fatal perversity of instinct, confided the finances of the kingdom to Calonne, an upper-class official and a veritable Cagliostro of finance.

From 1785 to 1787, this man organized his astounding system of falsification all along the line. His unbridled prodigality, by spreading a belief in unlimited resources, augmented the confidence necessary for the success of perpetual loans; until the day came when, having exhausted the system, he tried to suppress privilege and fall back upon the social reforms of Turgot, and the financial schemes of Necker, by suggesting once more to the assembly of notables a territorial subsidy from all landed property. He failed, owing to the same reaction that was causing the feudal system to make inroads upon the army, the magistracy and industry; but in his fall he put on the guise of a reformer, and by a last wild plunge he left the monarchy, already compromised by the affair of the Diamond Necklace (q.v.), hopelessly exposed (April 1787).

The volatile and brilliant archbishop Loménie de Brienne was charged with the task of laying the affairs of the ancien régime before the assembly of notables, and with asking the nation for resources, since the monarchy could no longer provide for itself; but the notables refused, and referred the minister to the states-general, the representative of the nation. Before resorting to this extremity, Brienne preferred to lay before the parlement his two edicts regarding a stamp duty and the territorial subsidy; to be met by the same refusal, and the same reference to the states-general. The exile of the parlement to Troyes, the arrest of various members, and the curt declaration of the king's absolute authority (November 9, 1787) were unsuccessful in breaking down its resistance. The threat of Chrétiens François de Lamoignon, keeper of the seals, to imitate Maupoue, aroused public opinion and caused a fresh Confederation of the parlements of the kingdom. The royal government was too much exhausted to overthrow even a decaying power like that of the parlements, and being still more afraid of the future representatives of the French people than of the supreme courts, capitulated to the insurgent parlements. The recalled parlement seemed at the pinnacle of power.

Recall of Necker.

Recall of Necker, 1787-1789.

Loménie de Brienne.

Calonne, 1783-1787.

The convocation of the states-general "according to the formula observed in 1614," as already demanded by the estates of Dauphiné at Vizille on the 21st of July 1788. The exchequer was empty; it was necessary to comply.

The royal declaration of the 23rd of September 1788 convoked the states-general for the 1st of May 1789, and the fall of Brienne and Lamoignon followed the recall of Necker. Thenceforward public opinion, which was looking for something quite different from the superannuated formula of 1614, abandoned the parlements, which in their turn disappeared from view; for the struggle beginning between the privileged classes and the government, now at bay, had given the public, through the states-general, that means of expression which they had always lacked.

The conflict immediately changed ground, and an engagement began between privilege and the people over the twofold question of the number of deputies and the mode of voting. Voting by head, and the double representation of the third estate (hiers etal); this was the great revolution; voting by order meant the
continued domination of privilege, and the lesser revolution. The monarchy, standing apart, held the balance, but needed a decisive policy. Necker, with little backing at court, could not act energetically, and Louis XVI., wavering between Necker and the queen, chose the attitude most convenient to his indolence and least to his interest: he remained neutral, and his timidity showed clearly in the council of the 27th of December 1788. Separating the two questions which were so closely connected, and despite the sensational brochure of the abbé Sieyès, “What is the Third Estate?” he pronounced for the doubling of the third estate without deciding as to the vote by head, yet leaving it to be divined that he preferred the vote by order. As to the programme there was no more decisive resolution; but the edict of convocation gave it to be understood that a reform was under consideration: “the establishment of lasting and permanent order in all branches of the administration.” The point as to the place of convocation gave rise to a compromise between the too-distant centre of France and too-tumultuous Paris. Versailles was chosen “because of the hunting!” In the procedure of the elections the traditional system of the states-general of 1614 was preserved, and the suffrage was almost universal, but in two kinds: for the third estate all citizens over twenty years of age, paying a direct tax, by a direct representation, voted—peasants as well as bourgeois; the country clergy were included among the ecclesiastics; the smaller nobility among the nobles; and finally, Protestants were electors and eligible.

According to custom, documents (cahiers) were drawn up, containing a list of grievances and proposals for reform. All the orders were agreed in demanding prudently modified reform: the vote on the budget, order in finance, regular convocation of the states-general, and a written constitution in order to get rid of arbitrary rule. The address of the clergy, inspired by the great prelates, sought to make inaccurate lamentations over the progress of impiety a means of safeguarding their enormous spiritual and temporal powers, their privileges and exemptions, and their vast wealth. The nobility demanded voting by order, the maintenance of their privileges, and, above all, laws to protect them against the arbitrary proceedings of royalty. The third estate insisted on the vote by head, the graduated abolition of privilege in all governmental affairs, a written constitution before any royal reform. The programme went on broadening as it ascended in the social scale.

The elections sufficed finally to show that the ancien régime, characterized from the social point of view by inequality, from the political point of view by arbitrariness, and from the religious point of view by intolerance, was completed from the administrative point of view by inextricable disorder. As even the extent of the jurisdiction of the baillis was unknown, convocations were made at haphazard, according to the good pleasure of influential persons, and in these assemblies decisions were arrived at by a process that confused every variety of rights and powers, and was governed by no logical principle; and in this extreme confusion terms and affairs were alike involved.

Whilst the bureaucracy of the ancien régime sought for desperate expedients to prolong its domination, the whole social body gave signs of a yet distant but ever nearing disintegration. The revolution was already complete before it was declared to the world. Two distinct currents of disaffection, one economic, the other philosophic, had for long been pervading the nation. There had been much suffering throughout the 17th and 18th centuries, but no one had hitherto thought of a politico-social rising. But the other, the philosophic current, had been set going in the 18th century; and the policy of despotism tempered by privilege had been criticized in the name of liberty as no longer justifying itself by its services to the state. The ultramontane and oppressively burdensome church had been taunted with its lack of Christian charity, apostolic poverty and primitive virtue. All vitality had been sapped from the old order of nobles, reduced in prestige by the sotavonette d'étafaine (office purchased to ennoble the holder), enervated by court life, and so robbed of its roots in the soil, from which it had once drawn its strength, that it could no longer live save as a ruinous parasite on the central monarchy. Lastly, to come to the bottom of the social scale, there were the common people, taxable at will, subject to the arbitrary and burdensome forced labour of the cortèges, cut off by an impassable barrier from the privileged classes whom they hated. For them the right to work had been asserted, among others by Turgot, as a natural right opposed to the caprices of the arbitrary and selfish aristocracy of the corporations, and a breach had been made in the tyranny of the masters which had endeavoured to set a barrier to the astonishing outburst of industrial force which was destined to characterize the coming age.

The outward and visible progress of the Revolution, due primarily to profound economic disturbance, was thus accelerated and rendered irresistible. Economic reformers found a moral justification for their dissatisfaction in philosophical theories; the chance conjunction of a philosopho-political idea with a national deficit led to the preponderance of the third estate at the elections, and to the predominance of the democratic spirit in the states-general. The third estate, which alone assumed the liberty above described, invited the same only, as a means of guarantee for the former. They wanted the abolition of the feudal system, the establishment of equality and a share in power. Neither the family nor property was violently attacked; the church and the monarchy still appeared to most people two respectable and respected institutions. The king and the privileged classes had but so to desire it, and the revolution would be easy and peaceful.

Louis XVI. was reluctant to abandon a tittle of his absolute power, nor would the privileged classes sacrifice their time-honoured traditions; they were inexorable. The king, more pensive and irresolve every day, vacillated between Necker the liberal on one side and Marie Antoinette, whose feminine pride was opposed to any concessions, with the comte d’Artois, a mischievous nobody who could neither choose a side nor stick to one, on the other. When the states-general opened on the 5th of May 1789 Louis XVI. had decided nothing. The conflict between him and the Assembly immediately broke out, and became acute over the verification of the mandates; the third estate desiring this to be made common by the deputies of the other orders, which would involve votes by head, the suppression of classes and the preponderance of the third estate. On the refusal of the privileged classes and after an interval of six weeks, the third estate, considering that they represented 96% of the nation, and in accordance with the proposal of Sieyès, declared that they represented the nation and therefore were authorized to take resolutions unaided, the first being that in future no arrangement for taxation could take place without their consent.

The king, urged by the privileged classes, responded to this first revolutionary act, as in 1614, by closing the Salle des Menus Plaisirs where the third estate were sitting; whereupon, gathered in one of the tennis-courts under the presidency of Bailly, they swore on the 20th of June not to separate before having established the constitution of the kingdom.

Louis XVI. then decided, on the 23rd, to make known his policy in a royal lit de justice. He declared for the lesser reform, the fiscal, not the social; were this rejected, he declared that he alone would arrange for the welfare of his people. Meanwhile he had summoned the third estate, opened the 17th, and demanded the immediate dispersal of the Assembly. The third estate refused to obey, and by the mouth of Bailly and Mirabeau asserted the legitimacy of the Assembly. The refusal of the soldiers to coerce the Assembly showed that the monarchy could no longer rely on the army; and a few days later, when the lesser nobility and the lower ranks of the clergy had united with the third estate whose cause was their own, the king yielded, and on the 27th of June commanded both orders to join in the National Assembly, which was thereby
recognized and the political revolution sanctioned. But at the same time, urged by the “infernal cabal” of the queen and the comte d’Artois, Louis XVI. called in the foreign regiments; only one of which he could be certain—and dismissed Necker. The Assembly, dreading a sudden attack, demanded the withdrawal of the troops. Meeting with a refusal, Paris opposed the king’s army with her citizen-soldiers; and by the taking of the Bastille, that mysterious dark fortress which personified the ancien régime, secured the triumph of the Revolution (July 14). The king was obliged to recall Necker, to mount the tricolor cockade at the Hôtel de Ville, and to recognize Bailly as mayor of Paris and La Fayette as commander of the National Guard, which remained in arms after the victory. The National Assembly had right on its side after the 20th of June and might after the 14th of July. Thus was accomplished the Revolution which was to throw into the melting-pot all that had for centuries appeared fixed and stable.

As Paris had taken her Bastille, it remained for the towns and country districts to take theirs—all the Bastilles of feudalism. Want, terror and the contagion of examples precipitated the disruption of governmental authority and of the old political status; and sudden anarchy disassociated all the organs of authority. Upon the ruins of the central administration temporary authorities were founded in various isolated localities, limited in area but more the less defiant of the government. The provincial assemblies of Dauphiné and elsewhere gave the signal; and numerous towns, following the example of Paris, instituted municipalities which substituted their authority for that of the.intendants and their subordinates. Clubs were openly organized, pamphlets and journals appeared, regardless of administrative orders; workmen’s unions multiplied in Paris, Bordeaux and Lyons, in face of drastic prohibition; and anarchy finally set in with the defection of the army in Paris on the 23rd of June, at Nancy, at Metz and at Brest. The crying abuses of the old régime, an insignificant factor at the outset, soon combined with the widespread agrarian distress, due to the unjust distribution of land, the disastrous exploitation of the soil, the actions of the government, and the severe winter of 1788. Discontent showed itself in pillage and incendiary on country estates; between March and July 1789 more than three hundred agrarian riots took place, uprooting the feudal idea of property, already compromised by its own excesses. Not only did pillaging take place; the boundaries or property were also ignored, and people no longer held themselves bound by tax. These jacqueries hastened the movement of the regular levée de trois ans.

The decrees of the 4th of August, proposed by those noble “patriots” the duc d’Aiguillon and the vicomte de Noailles, who had already on the 23rd of June made armed resistance to the evacuation of the Hall of Assembly, put the final touch to the revolution begun by the provincial assemblies, by liberating land and labour, and proclaiming equality among all Frenchmen. Instead of exasperating the demands of the peasants and workmen by repression and raising civil war between the bourgeoisie and the proletariat, they drew a distinction between personal servitude, which was suppressed, and the rights of contract, which were to be redeemed—a laudable but impossible distinction. The whole feudal system crumbled before the revolutionary inconsistence of the peasants; for their masters, bourgeois or nobles, terrified by prolonged riots, capitulated and gradually had to consent to make the resolutions of the 4th of August a reality.

Overjoyed by this social liberation, the Assembly awarded Louis XVI. the title of “renouveau of French liberty”; but respectful, faithful to his hereditary policy of 22nd of May, he ratified the decrees of the 4th of August, only with a very ill grace. On the other hand, the privileged classes, and notably the clergy, who saw the whole traditional structure of their power threatened, now rallied to him, and when after the 28th of August the Assembly set to work on the new constitution, they combined in the effort to recover some of the position they had lost. But whatever their theoretical agreement on social questions, politically they were hopelessly at odds. The bourgeoisie, conscious of their opportunity, decided for a single chamber against the will of the noblesse; against that of the king they declared it permanent, and, if they accorded him a suspensory veto, this was only in order to guard them against the extreme assertion of popular rights. Thus the progress of the Revolution, so far, had left the mass of the people still excluded from any constitutional influence on the government, which was in the hands of the well-to-do classes, which also controlled the National Guard and the municipalities. The irritation of the disfranchised proletariat was moreover increased by the appalling dearth of bread and food generally, which the suspicious temper of the times—fomented by the tirades of Marat in the Ami du peuple—ascribed to English intrigues in revenge for the aid given by France to the American colonies, and to the treachery in high places that made these intrigues successful. The climax came with the rumour that the court was preparing a new military coup d’état, a rumour that seemed to be confirmed by indiscreet toasts proposed at a banquet by the officers of the guard at Versailles; and on the night of the 5th to the 6th of October a Parisian mob forced the king and royal family to return with them to Paris amid cries of “We are bringing the baker, the baker’s wife and the little baker’s boy!” The Assembly followed; and henceforth king and Assembly were more or less under the influence of the whims and passions of a populace maddened by want and suspicion, by the fanatical or unscrupulous incitements of an unfettered press, and by the unrestrained oratory of obscure demagogues in the streets, the cafés and the political clubs.

Convened for the purpose of elaborating a system that should conciliate all interests, the Assembly thus found itself forced into a conflict between the views of the people, who feared betrayal, and the court, which dreaded being overwhelmed. This schism was reflected in the parties of the Assembly; the absolutists of the extreme Right; the moderate monarchists of the Right and Centre; the constitutionalists of the Left Centre and Left; and, finally, on the extreme Left the democratic revolutionists, among whom Robespierre sat as yet all but unnoticed. Of talent there was enough and to spare in the Assembly; what was conspicuously lacking was common sense and a practical knowledge of affairs. Of all the orators who declaimed from the tribune, Mirabeau alone realized the perils of the situation and possessed the power of mind and will to maintain the balance. The United States, however, had been discredited by a disreputable past, and yet more by the equivocal attitude he had to assume in order to maintain his authority in the Assembly while working in what he believed to be the true interests of the court. His political ideal for France was that of the monarchy, rescued from all association with the abuses of the old régime and “broad-based upon the people’s will”; his practical counsel was that the king should frankly proclaim this ideal to the people as his own, should compete with the Assembly for popular favour, while at the same time using every means to win over those by whose authority he was flouted. For a time Mirabeau influenced the counsels of the court through the comte de Montmorin; but the king neither trusted him nor could be brought to see his point of view, and Marie Antoinette, though she resigned herself to negotiating with him, was very far from sympathizing with his ideals. Finally, all hope of the conduct of affairs being entrusted to him was shattered when the Assembly passed a law forbidding its members to become ministers.

The attempted reconciliation with the king having failed, the Assembly ended by working alone, and made the control that it should have exerted an instrument, not of cooperation but of strife. It inaugurated its legislative labours by a metaphysical declaration of the Rights of Man and of the Citizen (October 2, 1789). This enunciation of universal verities, the bulk of which have, sooner
or later, been accepted by all civilized nations as "the gospel of modern times," was inspired by all the philosophy of the 18th century in France and by the *Contrat Social*. It comprised various rational and humane ideas, no longer theological, but profoundly and deliberately thought out: ideas as to the sovereign-right of the nation, law by general consent, man superior to the pretensions of caste and the fetters of dogma, the vindication of the ideal and of human dignity. Unable to rest on historic precedent like England, the Constituent Assembly took as the basis for its labours the tradition of the thinkers.

Upon the principles proclaimed in this Declaration the constitution of 1791 was founded. Its provisions are discussed elsewhere (see the section below on *Law and Institutions*); here it will suffice to say that it established under the sovereign people, for the king was to survive merely as the supreme executive official, a wholly new model of government in France, both in Church and State. The historic divisions of the realm were wiped out; for the old provinces were substituted eighty-three departments; and within the provinces were formed the departments, territorial, administrative and ecclesiastical, of the *ancien régime*. In one respect, indeed, the system of the old monarchy remained intact; the tradition of centralization established by Louis XIV. was too strong to be overthrown, and the destruction of the historic privileges and immunities with which this had been ever in conflict only served to strengthen this tendency. In 1791 France was pulverized into innumerable administrative atoms incapable of cohesion; and the result was that Paris became more than ever the brain and nerve-centre of France. This fact was soon to be fatal to the new constitution, though the administrative system established by it still survives. Paris was in effect dominated by the armed and organized proletariat, and this proletariat could never be satisfied with a settlement which, while proclaiming the sovereignty of the people, had, by means of the property qualification for the franchise, established the political ascendancy of the middle classes. The settlement had, in fact, settled nothing; it had, indeed, merely intensified the profound cleavage between the opposing tendencies; for the democrats were alienated by the narrow franchise, the Civil Constitution of the Clergy, which cut at the very roots of the Catholic system, drove into opposition to the Revolution not only the clergy themselves but a vast number of their flocks.

The policy of the Assembly, moreover, hopelessly aggravated its misunderstanding with the king. Louis, indeed, accepted the constitution and attended the great Feast of Federation (July 14, 1790), when representatives from all the new departments assembled in the Champ de Mars to ratify the work of the Assembly; but the king either could not or would not say the expected word that would have dissipated mistrust. The Civil Constitution of the Clergy, too, seemed to him not only to violate his rights as a king, but his faith as a Christian also; and when the emigration of the nobility and the death of Mirabeau (April 2, 1791) had deprived him of his natural supporters and his only adviser, resuming the old plan of withdrawing to the army of the marquis de Bouillé at Metz, he made his ill-fated attempt to escape from Paris (June 20, 1791). The flight to Varennes was an irreparable error; for during the king's absence and until his return the insignificance of the royal power became apparent. La Fayette's fusilade of the republicans, who demanded the deposition of the king (July 17, 1791), led to a definite split between the democratic party and the bourgeois party. Vainly did Louis, brought back a captive to Paris, swear on the 14th of September 1791 solemnly mere lip-service to the constitution; the mistrustful party of revolution abandoned the constitution they had only just obtained, and to guard against the sovereign's mental reservations and the selfish policy of the middle classes, appealed to the main force of the people. The conflict between the *ancien régime* and the National Assembly ended in the defeat of the royalists.

Through latitude or disinterestedness the men of 1791, on Robespierre's suggestion, had committed one last mistake, by leaving the task of putting the constitution into practice to new men even more inexperienced than themselves. Thus the new Assembly's time was occupied in a conflict between the Legislative Assembly and the king, who plotted against it; and, as a result, the monarchy, insulted by the proceedings of the 20th of June, was eliminated altogether by those of the 10th of August 1792.

The new Assembly which had met on the 1st of October 1791 had a majority favourable to the constitutional monarchy and to the bourgeois franchise. But, among these bourgeois those who were called Feuillants, from the name of their club (see FEUILLANTS, CLUB DE), desired the strict and loyal application of the constitution without encroaching upon the authority of the king; the triumvirate, Duport, Barnave and Lameth, were at the head of this party. The Jacobins, on the contrary, considered that the king should merely be hereditary president of the Republic, to be deposed if he attempted to violate the constitution, and that universal suffrage should be established. The dominant group among these was that of the Girondists or Girondists, so called because its most brilliant members had been elected from the Gironde (see GIRONDISTS). But the republican party was more powerful without than within. Their chief was not so much Robespierre, president of the parliamentary and bourgeois club of the Jacobins (q.v.), which had acquired from its two thousand affiliated branches great power in the provinces, as the advocate Danton, president of the popular and Parisian club of the Cordeliers (q.v.). Between the Feuillants and the Jacobins, the independents, incapable of keeping to any fixed programme, vacillated sometimes to the right, sometimes to the left.

But the best allies of the republicans against the Feuillants were the royalists pure and simple, who cared nothing about the constitution, and claimed to "extract good from the excess of evil." The election of a Jacobin, Pétion, instead of Bailly, the resigning mayor, and La Fayette, the candidate for office, was their first achievement. The court, on its side, showed little sign of a conciliatory spirit, though, realizing its danger, it attempted to restrain the foolish violence of the *émigrés*, i.e. the nobles who after the suppression of titles of nobility in 1790 and the arrest of the king at Varennes, had fled in a body to Coblenz and joined Louis XVI.'s brothers, the counts of Provence and Artois. They it was who set in motion the national and European conflict. Under the prince of Condé they had collected a little army round Trier; and in concert with the "Austrian Committee" of Paris they solicited the armed intervention of monarchical Europe. The declaration of Pilutz, which was but an excuse for non-interference on the part of the emperor and the king of Prussia, interested in the prolongation of these internal troubles, was put forward by them as an assurance of forthcoming support (August 27, 1791). At the same time the application of the Civil Constitution of the Clergy roused the whole of western La Vendée; and in face of the danger threatened by the refractory clergy and by the army of the *émigrés*, the Girondins set about confounding the support with the Feuillants in the minds of the people, and compromising Louis XVI. by a national agitation, denouncing him as an accomplice of the foreigner. Owing to the decrees against the comte de Provence, the emigrants, and the refractory priests, voted by the Legislative Assembly in November 1791, they forced Louis XVI. to show his hand by using his veto, so that his complicity should be plainly declared, to replace his Feuillant ministry—disparate in birth, opinions and ambitions—by the Girondin ministry of Dumouriez-Roland (March 10), no more united than the other, but believers in a republican crusade for the overthrow of thrones, that of Louis XVI. first of all; and finally to declare war against the king of Bohemia and Hungary, a step also desired by the court in the hope of ridding itself of the Assembly at the first note of victory (April 20, 1792).
But when, owing to the disorganization of the army through emigration and desertion, the ill-prepared Belgian war was followed by invasion and the trouble in La Vendée had thus in the fall France lay had a betrayal. The Assembly, in order to reduce the number of hostile forces, voted for the exile of all priests who had refused to swear to the Civil Constitution and the substitution of a body of twenty thousand volunteer national guards, under the authority of Paris, for the king's constitutional guard (May 27–June 8, 1792). Louis XVI's veto and the dismissal of the Girondin ministry—thanks to an intrigue of Dumouriez, analogous to that of Mirabeau and as ineffectual—dismayed the Feuillants and maddened the Girondins; the latter, to avert popular fury, turned it upon the king. The émeute of the 20th of June, a burlesque which, for the persistent good-humour of Louis XVI, might have become a tragedy, alarmed but did not overthrow the monarchy.

The bourgeoisie, the Assembly, the country and La Fayette, one of the leaders of the army, now embarked upon a royalist reaction, which would perhaps have been efficacious, had it not been for the entry into the affair of the Prussians as allies of the Austrians, and for the insolent manifesto of the duke of Brunswick. The Assembly's cry of "There was a time when the king was incapable of defending France against the foreigner; and the appeal of the federal volunteers in Paris gave to the opposition, together with the war-song of the Marseillaise, the army which had been refused by Louis XVI, now disarmed. The vain attempts of the Gironde to reconcile the king and the Revolution, the ill-advised decree of the Assembly on the 8th of August, freeing La Fayette from his guilt in forsaking his army; his refusal to vote for the deposition of the king, and the suspected treachery of the court, led to the success of the republican forces when, on the 10th of August, the mob of Paris organized by the revolutionary Commune rose against the monarchy.

The suspension and imprisonment of the king left the supreme authority nominally in the hands of the Assembly, but actually in those of the Commune, consisting of delegates from the administrative sections of Paris. Installed at the Hôtel de Ville this attempted to influence the discredited government, entered into conflict with the Legislative Assembly, which considered it an end which paralyzed the action of the executive council, particularly during the bloody days of September, provoked by the discovery of the court's intrigues with the foreigner, by the treachery of La Fayette, the capture of Longwy, the investiture of Verdun by the Prussians (August 19–30), and finally by the incendiary placards of Marat.

Danton, a master of diplomatic and military operations, had to avoid any rupture with the Commune. Fortunately, on the very day of the dispersal of the Legislative Assembly, Dumouriez saved France from a Prussian invasion by the victory of Valmy, and by unauthorized negotiations which prefurred those of Bonaparte at Léoben (September 22, 1792).

The popular insurrection against Louis XVI, determined the simultaneous fall of the bourgeois régime and the establishment of the democracy in power. The Legislative Assembly, without a mandate for modifying a constitution that had become inapplicable with the suspension of the monarch, had before disappearing convened a National Convention, and as the reward for its bravery in May had replaced the indirect franchise by universal suffrage. Public opinion became republican from an excess of patriotism, and owing to the propaganda of the Jacobin club; while the decree of the 25th of August 1792, which marked the destruction of feudalism, now abolished in principle, caused the peasants to rally definitely to the Republic.

This had hardly been established before it became distracted by the fratricidal strife of its adherents, from September 22, 1792, to the 18th Fructidor (September 4, 1797). The electoral assemblies, in very great majority, had desired this Republic to be democratic and equalizing in spirit, but on the face of it, liberal, uniform and propagandist; in consequence, the 782 deputies of the Convention were not divided on principles, but only by personal rivalries and ambition. They all wished for a unanimity and harmony impossible to obtain; and being unable to convince they destroyed one another.

The Girondins in the Convention played the part of the Feuillants in the Legislative Assembly. Their party was not well disciplined, they purposely refrained from making it so, and hence their ruin. Oratorically they represented the spirit of the South; politically, the ideas of the bourgeoisie in opposition to the democracy—which they despised although making use of it—and the federalist system, from an objection to the preponderance of Paris. Paris, on the other hand, had elected only deputies of the Mountain, as the more advanced of the Jacobins were called, that party being no more settled and united than the others. They drew support from the Parisian democracy, and considered the decentralization of the Girondins as endangering France's unity, circumstances demanding a strong and highly concentrated government; the proponents of the republic tended to resemble the tactics of the Polish republic of the Gironde. Between the two came the Plaine, the Marais, the troop of trembling bourgeois, sincerely attached to the Revolution, but very moderate in the defense of their ideas; some seeking a refuge from their timidity in hard-working committees, others partaking in the violence of the Jacobins out of weakness or for reasons of state.

The Girondins were the first to take the lead; in order to retain it they should have turned the Revolution into a government. They remained an exclusive party, relying on the mob but with no influence over it. Without a leader or popular power, they might have found both in Danton; for, occupied chiefly with the external danger, he made advances towards them, which they repulsed, partly in horror at the proceedings of September, but chiefly because they saw in him the most formidable rival in the path of the government. They waged war against him as relentlessly as did the Constitutionalists against Mirabeau, whom he resembled in his extreme ugliness and his volcanic eloquence. They drove him into the arms of Robespierre, Marat and the Commune of Paris. On the latter hand after the 3rd of September they declared Paris dangerous for the Convention, and wanted to reduce it to "eighty-three influential members." Danton and the Mountain responded by decreeing the unity and indivisibility of the Republic, in order to emphasize the suspicions of federalism which weighed upon the Girondins.

The trial of Louis XVI, still further enhanced the contrasts of ideas and characters. The discovery of fresh proofs of treachery in the iron chest (November 20, 1792) gave the Mountain a pretext for forcing on the clash of parties and raising the question not of legality but of public safety. By the execution of the king (January 21, 1793) they "cast down a king's head as a challenge to the kings of Europe." In order to preserve popular favour and their direction of the Republic, the Girondins had not dared to pronounce against the sentence of death, but had demanded an appeal to the people which was rejected; morally weakened by this equivocal attitude they were still more so by foreign events.

The king's death did not result in the unanimity so much desired by all parties; it only caused the reaction on themselves of the rewards which had been granted with the popular enthusiasm, and which upon the king, and also an augmentation in the armies of the foreigner, which obliged the revolutionists to face all Europe. There was a coalition of monarchs, and the people of La Vendée rose in defence of their faith. Dumouriez, the conqueror of Jemappes (November 6, 1792), who invaded Holland, was beaten by the Austrians (March 1793). A levy of 300,000 men was ordered; a Committee of General Security was charged with the search for suspects; and then forward military occurrences called forth parliamentary crises
and popular upheavals. Girondins and Jacobins unjustly accused one another of leaving the traitors, the conspirators, the "stipendiaries of Coblenz," unpunished. To avert the danger threatened by popular dissatisfaction, the Girondes was persuaded to vote for the creation of a revolutionary tribunal to judge suspects, while out of spite against Danton who demanded it, they refused the strong government which might have made a stand against the enemy (March 10, 1793). This was the first of the exceptional measures which were to call down ruin upon them. Whilst the insurrection in La Vendée was spreading, and Dumouriez falling back upon Neerwinden, sentence of death was laid upon émigrés and refractory priests; the treachery of Dumouriez, disappointed in his Belgian projects, gave grounds for all kinds of suspicion, as that of Mirabeau had formerly done, and led the Girondes to propose the new government which they had refused to Danton.

The transformation of the provisional executive council into the Committee of Public Safety—omnipotent in financial matters—was voted because the Girondins meant to control it; but Danton got the upper hand (April 6).

The Girondins, discredited in Paris, multiplied their attacks upon Danton, now the master; they attributed the civil war and the disasters of the foreign campaign to the despotism of the Paris Commune and the clubs; they accused Marat of instigating the September massacres; and they began the supreme struggle by demanding the election of a committee of twelve deputies, charged with breaking up the anarchy at the authorities in Paris (May 18).

The complete success of the Girondin proposals; the arrest of Hébert—the violent editor of the Père Duchêne; the insurrection of the Girondins of Lyons against the Montagnard Commune; the bad news from La Vendée—the military reverses; and the economic situation which had compelled the fixing of a maximum price of corn (May 4) excited the "moral insurrections" of May 31 and June 2. Marat himself sounded the tocsin, and Hanriot, at the head of the Parisian army, surrounded the Convention. Despite the efforts of Danton and the Committee of Public Safety, the arrest of the Girondins sealed the victory of the Mountain.

The threat of the Girondin Isard was fulfilled. The federalist insurrection, to avenge the violation of national representation, resulted in the Parisian insurrection. Sixty-nine departmental governments protested against the violence done to the Convention; but the ultra-democratic constitution of 1793 deprived the Girondins, who were arming in the west, the south and the centre, of all legal force. To the departments that were hostile to the dictatorship of Paris, and the tyranny of Danton or Robespierre, it promised the referendum, an executive of twenty-four citizens, universal suffrage, and the free exercise of religion. The populace, who could not understand this parliamentary quarrel, and were in a hurry to set up a national defence, abandoned the Girondins, and the latter excited the enthusiasm of only one person, Charlotte Corday, who by the murder of Marat ruined them irretrievably.

The battle of Bréauté was a defeat without a fight for their party without stamina and their general without troops (July 13); while on the 31st of October their leaders perished on the guillotine, where they had been preceded by the queen, Marie Antoinette. The Girondins and their adherents were differentiated by neither religious dissensions nor political divergence, but merely that of opinion. The Girondins, when in power, had had scruples which had not troubled them while scaling the ladder; idols of Paris, they had flattered her in turn, and when Paris scorned them they sought support in the provinces. A great responsibility for this defeat of the liberal and republican bourgeoisie, whom they represented, is to be laid upon Madame Roland, the Egeria of the party. An ardent patriot and republican, her relations with Danton resembled those of Marie Antoinette with Mirabeau, in each case a woman spilt by flattery, enraged at indifference. She was the ruin of the Gironde, but taught it how to die.

The fall of the Gironde left the country disturbed by civil war, and the frontiers more seriously threatened than before Valmy. Bouchotte, a totally inefficient minister for war, the Commune's man of straw, left the army without food or ammunition, while the suspected officers remained inactive. In the Anéngue Vendée the incapable leaders let themselves be beaten at Aubiers, Beaupréau and Touars, at a time when Cathelineau was taking possession of Saumur and threatening Nantes, the capture of which would have permitted the insurgents in La Vendée to join those of Brittany and receive provisions from England. Meanwhile, the remnants of the Girondin federalists were overcome by the disguised royalists, who had aroused the whole of the Rhône valley from Lyons to Marseilles, had called in the Sardinians, and handed over the fleet and the arsenal at Toulon to the English, whilst Paoli left Corsica at their disposal. The scarcity of money due to the discriminating of the asignats, the cessation of commerce, abroad and on the sea, and the bad harvest of 1793, were added to all these dangers, and formed a serious menace to France and the Convention.

This meant a hard task for the first Committee of Public Safety and its chief Danton. He was the only one to understand the conditions necessary to a firm government; he caused the government to arrest only in action; and he was convinced of the necessity of the Jacobins (July 17). He annulled the Convention and was itself the central authority, its organization in Paris being the twelve committees substituted for the provisional executive committee and the six ministers, the Committee of General Security for the maintenance of the police, and the arbitrary Revolutionary Tribunal. The execution of its orders in the departments was carried out by omnipotent representatives "on mission" in the armies, by popular societies—veritable missionaries of the Revolution—and by the revolutionary committees which were its backbone.

Despite this Reign of Terror Danton failed; he could neither dominate foes within nor divide those without. Representing the same and vigorous democracy, and like Jefferson a friend to liberty and self-government, he had been obliged to set up the most despotic of governments in face of internal anarchy and foreign invasion. Being of a statesman's understanding, he could not be a theorist nor a cabinet-minister, he held the views of a statesman without having a following sufficient to realize them. Moreover, the proceedings of the 2nd of June, when the Commune of Paris had triumphed, had dealt him a mortal blow. He is now tried to stem the tumultuous current which had borne him along, and to prevent discord; but the check to his policy of an understanding with Prussia and with Sardinia, to whom, like Richelieu and D'Argenson, he offered the realization of her transalpine ambition in exchange for Nice and Savoy, was added to the failure of his temporizing methods in regard to the federalist insurgents, and of his military operations against La Vendée. A man of action and not of cunning shifts, he succumbed on the 10th of July to the blows of his own government, which had passed from his hands into those of Robespierre, his ambitious and crafty rival.

The second Committee of Public Safety lasted until the 27th of July 1794. Composed of twelve members, re-eligible every month, and dominated by the triumvirate, Robespierre, Saint-Just and Couthon, it was stronger than ever, since it obtained the right of appointing leaders, disposed of money, and muzzled the press. Many of its members were sons of the bourgeoisie, men who having been educated at college, thanks to some charitable agency, in the pride of learning, and raised above their original station, were ready for anything but had achieved nothing. They had plenty of talent at command, were full of classical tirades against tyranny, and, though sensitive enough in their private life, were bloodthirsty butchers in their public relations. Such were Robespierre, Saint-Just, Couthon, Billard-Varenne, Cambon, Thuriot, Collot d'Herbois, Barrère and Prieur de la Mirande. Working hand in hand with these politicians, not
always in accordance with them, but preserving a solid front, was the specialist, Carnot, Robert Lindet, Jean Bon Saint-André and Prieur de la Côte d’Or, honourable men, anxious above all to safeguard their country. At the head of the former type Robespierre, without special knowledge or exceptional talent, devoted by jealous ambition and gifted with cold grave eloquence, enjoyed a great moral ascendancy, due to his incorruptible purity of life and the invariably correct behaviour that had been wanting in Mirabeau, and by the persevering will which Danton had lacked. His marching orders were: no more temporizing with the federalists or with generals who are afraid of conquering; war to the death with all Europe in the name of revolutionary propaganda and the monarchical tradition of national frontiers; and fear, as a means of government. The specialists answered foreign foes by their organization of victory; as for foes at home, the triumvirate crushed them beneath the Terror.

France was saved by them and by that admirable outburst of patriotism which provided 750,000 patriots for the army through the general levy of the 16th of August 1793, aided, moreover, by the mistakes of her enemies. Instead of profiting by Dumouriez’s treachery and the capture of La Vendée in the Coalition, divided over the resuscitated Polish question, lost time on the frontiers of this new Poland of the west which was sacrificing itself for the sake of a Universal Republic.

Thus in January 1794 the territory of France was cleared of the Prussians and Austrians by the victories at Hondschoote, Wattignies and Wissenburg; the army of La Vendée was repulsed from Granville, overwhelmed by Hoche’s army at Le Mans and Savenay, and its leaders shot; royalist sedition was suppressed at Lyons, Bordeaux, Marseilles and Toulon; federalist insurrections were wiped out by the terrible massacres of Carrier at Nantes, the atrocities of Lebon at Arras, and the wholesale executions of Fouché and Collot d’Herbois at Lyons; Louis XVI. and Marie Antoinette guillotined, the émigrés dispersed, denied or forsaken by all Europe.

But the triumphant Mountain was not as united as it boasted.

The second Committee of Public Safety had now to struggle against two oppositions: one of the left, represented by Hébert, the Commune of Paris and the Cordeliers; and the right, Duroc and the Convention, divided the former would not admit that the Terror was only a temporary method of defence; for them it was a permanent system which was even to be strengthened in order to crush all who were hostile to the Revolution. Their sanguinary violence was combined with an anti-religious policy, not atheistical, but inspired by mistrust of the clergy, and by a civic and deistic creed that was a direct outcome of the federalists. To these latter were due the substitution of the Republican for the Gregorian calendar and the secular Feasts of Reason (November 19, 1793).

The followers of Hébert wanted to push forward the movement of May 31, 1793, in order to become masters in their turn; while those of Danton were by way of arresting it. They considered it time to re-establish the regime of ordinary laws and justice; sick of bloodshed, with Camille Desmoulins they demanded a “Committee of Clemency.”

A deist and therefore hostile to “anti-religious masquerades,” while uneasy at the absolute authority of the Paris Commune, which aimed at suppressing the State, and at its armed propaganda abroad, Robespierre resumed the struggle against its illegal power, so in La Vendée. His bills succeeded (March 24, 1794), and then, jealous of Danton’s activity and statesmanship, and exasperated by the jeers of his friends, he rid himself of the party of tolerance by a parody of justice (April 5).

Robespierre now stood alone. During five months, while affecting to be the representative of “a reign of justice and virtue,” he laboured at strengthening his political-religious dictatorship—already so formidable armed—with new powers. “The incorruptible wanted to become the invulnerable” and the scaffold of the guillotine was crowded. By his dogma of the supreme state Robespierre founded a theocratic government with the police as an Inquisition. The Festival of the new doctrine, which turned the head of the new pontiff (May 8), the loi de Prairial, or “code of legal murder” (June 16), which gave the deputies themselves into his hand; and the multiplication of executions at a time when the victory of Fleurus (June 25) showed the uselessness and barbarity of this aggravation of the Reign of Terror provoked against him the victorious coalition of revenge, lassitude and fear. Vanquished and imprisoned, he refused to take part in the illegal action proposed by the Commune against the Convention. Robespierre was no man of action. On the 9th Thermidor (July 27, 1794) he fell into the gulf that had opened on the 31st of May, and through which the 18th Brumaire was visible.

Although brought about by the Terrorists, the tragic fall of Robespierre put an end to the Reign of Terror; for their chiefs having disappeared, the subordinates were too much divided to keep up the dictatorship of the third Committee of Public Safety, and reaction soon set in.

After a change in personnel in favour of the surviving Dantonists, came a limitation to the powers of the Committee of Public Safety and the withdrawal of the Convention, and next followed the destruction of the government system, the Girondin decentralization and the resuscitation of departmental governments; the reform of the Revolutionary Tribunal on the 10th of August; the suppression of the Commune of Paris on the 1st of September; and of the salary of forty sous given to members of the sections; the abolition of the maximum, the suppression of the Guillotine, the opening of the prisons, the closing of the Jacobin club (November 11), and the hence-forward insignificant existence of the popular societies.

Power reverted to the Girondins and Dantonists, who re-entered the Convention on the 18th of December; but with them re-entered likewise the royalists of Lyons, Marseilles and Toulon, and further, after the peace of Basel, many young men set free from the army, hostile to the Jacobins and defenders of the now moderate and peace-making Convention. These muscadins and incroyables, led by Fréron, Tallien and Barras—former revolutionists who had become aristocrats—profited by the restored liberty of the press to prepare for days of battle in the salons of the “incommodateurs” Tallien and Barras, and Staal and Madame Récamier, as the sans-culottes had formerly done in the clubs. The remnants of Robespierre’s faction became alarmed at this Thermidor reaction, in which they scented royalism.

Aided by famine, by the suppression of the maximum, and by the imminent bankruptcy of the assignats, they despaired of aroused the working classes and the former Hanriot companies against a government which was trying to destroy the republic, and had broken the boces of Marat and guillotined Carrier and Fouquier-Tinville, the former public prosecutor.

Thus the risings of the 12th of Germinal and the 5th of Prairial (April 1, 1795) and the 1st of Prairial (May 20) were economic revolts rather than insurrections excited by the deputies of the Mountain; in order to suppress them the reactionaries called in the army. Owing to this first intervention of the troops in politics, the Committee of Public Safety, which aimed not so much at a moderate policy as at steering a middle course between the Thermidorian of the Right and of the Left, was able to dispense with the latter.

The royalists were aware that their hour had come. In the south, the companions of Jehu and of the Sun inaugurated a “White Terror,” which had not even the apparent excuse of the public safety or of exasperated patriotism.

At the same time they prepared for a twofold insurrection against the republic—in the west with the help of England, and in the east with that of Austria—and by an attempt to bribe General Pichegru. But though the heads of the government wanted to put an end to the Revolution they had no thought of restoring the monarchy in favour of the Comte de Provence, who had taken the title of Louis XVIII. on hearing of the death of the dauphin in the Temple, and still less of bringing
back the ancien régime. Hoche crushed the insurrection of the Chouans and the Bretons at Quiberon on the 2nd of July 1795, and Pichegru, scared, refused to entangle himself any further.

To cut off all danger from royalists or terrorists the Convention now voted the Constitution of the year III; suppressing that of 1793, in order to counteract the terrorists, and re-establishing the bourgeois limited franchise with election in two degrees—a less liberal arrangement than that granted from 1789 to 1792. The chambers of the Five Hundred and of the Ancients were elected by the moneyped and intellectual aristocracy, and were to be re-elected by thirds annually. The executive authority, entrusted to five Directors, was no more than a definite and very strong Committee of Public Safety; but Siéyès, the author of the new constitution, in opposition to the royalists, had secured places of refuge for his party by reserving posts as directors for the regicides, and two-thirds of the deputies' seats for members of the Convention. In self-defence against this continuance of the policy and the personnel of the Convention—a modern "Long Parliament"—the royalists, persistent street-fighters and masters in the "sections" after the suppression of the daily indemnification of forty sous, attempted the insurrection of the 13th Vendémiaire (October 5, 1795), which was easily put down by General Bonaparte.

Thus the bourgeois republic reaped the fruits of its predecessor's external policy. After the freeing of the land in January 1794, an impulse had been given to the spirit of conquest which had gradually succeeded to the diseased fever of propaganda and overheated patriotism. This it was which had sustained Robespierre's dictatorship; and, owing to the "amalgam" and the re-establishment of discipline, Belgium and the left bank of the Rhine had been conquered and Holland occupied, simultaneously with Kosciusko's rising in Poland, Prussia's necessity of keeping and extending her Polish acquisitions, Robespierre's death, the prevalent desires of the majority, and the continued victories of Pichegru, Jourdan and Moreau, enfeebled the coalition. At Basel (April—July 1795) republican France, having rejoined the concert of Europe, signed the long-awaited peace with Prussia, Spain, Holland and the grand-duke of Tuscany. But thanks to the past influence of the Girondin party, who had caused the war, and of the regicides of the Mountain, this peace not only ratified the conquest of Belgium, the left bank of the Rhine and Santo Domingo, but paved the way for fresh conquests; for the old spirit of domination and persistent hostility had attracted the destinies of the Revolution definitely towards war.

The work of internal construction amidst this continued battle against the whole world had been no less remarkable. The Constituent Assembly had been more destructive than constructive; but the Convention preserved intact those fundamental principles of civil liberty which had been the main results of the Revolution: the equality so dear to the French, and the sovereignty of the people—the foundation of democracy. It also managed to engage private interests in state reform by creating the Grand Livre de la Dette Publique (September 13—26, 1793), and enlisted peasant and bourgeois savings in social reforms by the distribution and sale of national property. But with views reaching beyond equality of rights to a certain equality of property, the committees, as regards legislation, poor relief and instruction, laid down principles which have never been realized, save in the matter of the metric system; so that the Convention which was dispersed on the 16th of October 1795 made a greater impression on political history and social ideas than on institutions. Its disappearance left a great blank.

During the four years the Directory attempted to fill this blank. Being the outcome of the Constitution of the year III., it should have been the organizing and pacifying government of the Republic; in reality it sought not to create, but to preserve its own existence. Its internal weakness, between the danger of anarchy and the opposition of the monarchists, was extreme; and it soon became discredited by its own coup d'état and by financial impotence in the eyes of a nation sick of revolution, aspiring towards peace and the resumption of economic undertakings. As to foreign affairs, its aggressive policy imperilled the conquests that had been the glory of the Convention, and caused the frontiers of France, the defence of which had been a point of honour with the Republic, to be called in question. Finally, there was no real government on the part of the five directors: La Révoluère-Lépeaux, an honest man but weak; Reubell, the negotiator of the Hague; Letourneur, an officer of talent; Barras, a man of intrigue, corrupt and without real convictions; and Carnot, the only really worthy member. They never understood one another, and never consulted together in hours of danger, save to embroil matters in politics as in war. Leaning on the bourgeois, conservative, liberal and anti-clerical republicans, they were no more able than was the Thermidor party to re-establish the freedom that had been suspended by revolutionary despotism; they created a ministry of police, interdicted the clubs and popular societies, distracted the press, and with partiality undertook the separation of Church and State voted on the 18th of September 1794. Their real defence against counter revolution was the army; but, by a further contradiction, they reinforced the army attached to the Revolution while seeking an alliance with the peace-loving bourgeoisie. Their party had therefore no more homogeneity than had their policy.

Moreover the Directory could not govern alone; it had to rely upon two other parties, according to circumstances: the republican-democrats and the disguised royalists.

The former, purely anti-royalist, thought only of remedying the sufferings of the people. Roused by the collapse of the assignats, following upon the ruin of industry and the arrest of commerce, they were still further exasperated by the speculations of the financiers, by the jobbery which prevailed throughout the administration, and by the sale of national property which had profited hardly any but the bourgeoisie. After the 13th Vendémiaire the royalists too, deceived in their hopes, were expecting to return gradually to the councils, thanks to the high property qualification for the franchise. Under the name of "moderates" they demanded an end to this war which England continued and Austria threatened to recommence, and that the Directory from self-interested motives refused to conclude; they desired the abandonment of revolutionary proceedings, order in finance and religious peace.

The Directory, then, was in a minority in the country, and had to be ever on the alert against faction; all possible methods seemed legitimate, and during two years appeared successful. Order was maintained in France, even the royalist west being pacified, thanks to Hoche, who finished his victorious campaign of 1796 against Stofflet, Charette and Cadoudal, by using mild and just measures to complete the subjection of the country. The greatest danger lay in the republican-democrats and their socialist ally, François Noel ("Gracchus") Babeuf (q.v.). The former had united the Jacobins and the more violent members of the Convention in their club, the Société du Panthéon; and their fusion, after the closing of the club, with the secret society of the Babouvists lent formidable strength to this party, with which Barras was secretly in league. The terrorist party, deprived of its head, had found a new leader, who, by developing the consequences of the Revolution's acts to their logical conclusion, gave first expression to the levelling principle of communism. He proclaimed the right of property as appertaining to the state, that is, to the whole community; the doctrine of equality as applied to social, and inequality of any kind—that of property as well as that of rank; and finally the inadequacy of the solution of the agrarian question, which had profited scarcely any one, save a new class of privileged individuals. But these socialist demands were premature; the attack of the camp of Grenelle upon constitutional order...
ended merely in the arrest and guillotining of Babeuf (September 9, 1796–May 25, 1797). The liquidation of the financial inheritance of the Convention was no less difficult. The successive issues of assignats, and the multiplication of counterfeits made abroad, had so depreciated this paper money that an assignat of 100 francs was in February 1796 worth only 30 centimes; while the government, obliged to accept them at their nominal value, no longer collected any taxes and could not pay salaries. The destruction of the plate for printing assignats, on the 18th of February 1796, did not prevent the drop in the forty milliards still in circulation. Territorial mandates were now tried, which inspired no greater confidence, but served to liquidate two-thirds of the debt, the remaining third being consolidated by its dependence on the Grand Livre (September 30, 1797). This widespread bankruptcy, falling chiefly on the bourgeoisie, inaugurated a reaction which lasted until 1810 against the chief principle of the Constituent Assembly, which had favoured indirect taxation as producing a large sum without imposing any very obvious burden. The bureaucrats of the old system—having returned to their offices and being used to these indirect taxes—resented their assistance, and thus the Directory was enabled to maintain its struggle against the Coalition.

All system in finance having disappeared, war provided the Directory, now in extremis, with a treasury, and it was its only source for supplying constitutional needs; while it opened a path to the military commanders who were to be the support and the glory of the state. England remaining invulnerable in her insular position despite Hoche's attempt to land in Ireland in 1796, the Directory resumed the traditional policy against Austria of conquering the natural frontiers, Carnot furnishing the plans; hence the war in southern Germany, in which Jourdan and Moreau were repulsed by an inferior force under the archduke Charles, and Bonaparte's triumphant Italian campaign. Chief of an army that he had made irresistible, not by honour but by glory, and master of wealth by rapine, Bonaparte imposed his will upon the Directory, which he provided with funds. After having separated the Piedmontese from the Austrians, whom he drove back into Tyrol, and repulsed offensive reprisals of Wurmser and Alvinzi on four occasions, he stopped short at the preliminary negotiations of Léoben just at the moment when the Directory, discouraged by the problem of Italian reconstitution, was preparing the army of the Rhine to re-enter the field under the command of Hoche. Bonaparte thus gained the good opinion of peace-loving Frenchmen; he partitioned Venetian territory with Austria, contrary to French interests but conformably with his own in Italy, and henceforward was the decisive factor in French and European policy, like Caesar or Pompey of old. England, in consternation, offered in her turn to negotiate at Lille.

These military successes did not prevent the Directory, like the Thermidorian, from losing ground in the country. Every strategic truce since 1795 had been marked by a political crisis; peace reawakened opposition. The constitutional party, royalist in reality, had made alarming progress, partly owing to the Babouvist conspiracy; they now tried to corrupt the republican generals, and Condé procured the treachery of Pichegru, Kellermann and General Ferrand at Besançon. Moreover, their Clichy club, directed by the abbé Brottier, manipulated Parisian opinion; while many of the refractory priests, having returned after the liberal Public Worship Act of September 1795, made active propaganda against the principles of the Revolution, and plotted the fall of the Directory as maintaining the State's independence of the Church. Thus the partial elections of the year V. (May 20, 1797) had brought back into the two councils a counter-revolutionary majority of royalists, constitutionalists of 1791, Catholics and moderates. The Directeur Letourneur had been replaced by Barthélemy, who had negotiated the treaty of Basel and was a constitutional monarchist. So that the executive not only found it impossible to govern, owing to the opposition of the councils and a vehement press-campaign, but was distracted by ceaseless internal conflict. Carnot and Barthélemy wished to meet ecclesiastical opposition by legal measures only, and demanded peace; while Barras, La Révellière and Reubell saw no other remedy save military force. The attempt of the counter-revolutionaries to make an army for themselves out of the guard of the Legislative Assembly, and the success of the Catholics, who had managed at the end of August 1797 to repeal the laws against refractory priests, determined the Directory to appeal from the rebellious parliament to the ready swords of Augereau and Bernadotte. On the 18th Fructidor (September 4, 1797) Bonaparte's lieutenants, backed up by the whole army, stopped the elections in forty-nine departments, and deported to Guiana many deputies of both councils, journalists and non-juring priests, as well as the director Barthélemy, though Carnot escaped into Switzerland. The royalist party was once more overthrown, but with it the republican constitution itself. Thus every act of violence still further confirmed the new empire of the army and the defeat of principles, preparing the way for military despotism.

Political and financial coups d'état were not enough for the directors. In order to win back public opinion, tired of interminable quarrels and sickened by the scandalous immorality of the generals and of those in power, and to remove from Paris an army which after having given them a fresh lease of life was now a menace to them, war appeared their only hopeful course. They attempted to renew the designs of Louis XIV. and anticipate those of Napoleon. But Bonaparte saw what they were planning; and to the rupture of the negotiations at Lille and an order for the resumption of hostilities he responded by a fresh act of disobedience and the infliction on the Directory of the peace of Campo-Formio, on October 17, 1797. The directors were consoled for this enforced peace by acquiring the left bank of the Rhine and Belgium, and for the forfeiture of republican principles by attaining what had for so long been the ambition of the monarchy. But the army continued a menace. To avoid disbanding it, which might, as after the peace of Basel, have given the counter-revolution further auxiliaries, the Directory appointed Bonaparte chief of the Army of England, and employed Jourdan to revise the conscription laws so as to make military service a permanent duty of the citizen, since war was now to be the permanent object of policy. The Directory finally conceived the gigantic project of bolstering up the French Republic—the triumph which was celebrated by the peace of Campo-Formio—by forming the neighbouring weak states into tributary vassal republics. This system had already been applied to the Batavian republic in 1795, to the Ligurian and Cisalpine republics in June 1797; it was extended to that of Mulhausen on the 28th of January 1798, to the Roman republic in February, to the Helvetic in April, while the Parthenopaean republic (Naples) was to be established in 1799. This was an international coup de force, which presupposed that all these nations in whose eyes France was still respected once and for all had been appeased, and that though they had been beaten and pillaged they would not learn to conquer in their turn; and that the king of Sardinia, dispossessed of Milan, the grand-duke of Tuscany who had given refuge to the pope when driven from Rome, and the king of Naples, who had opened his ports to Nelson's fleet, would not find allies to make a stand against this hypocrical system.

What happened was exactly the contrary. Meanwhile, the armies were kept in perpetual motion, procuring money for the impeccuntant Directory, making a diversion for internal discontent, and also permitting of a “reversed Fructidor,” against the anarchists, who had got the upper hand in the partial elections of May 1798. The social danger was averted in its turn after the clerical danger had been dissipatd. The next task was to relieve Paris of Bonaparte, who had already refused to repeat Hoche's unhappy expedition to Ireland and to attack England at home without either money or a navy. The pecuniary
The resources of Berne and the wealth of Rome fortunately tided over the financial difficulty and provided the expedition to Egypt, which permitted Bonaparte to wait "for the fruit to ripen"—i.e., till the Directory should be ruined in the eyes of France and of all Europe. The disaster of Aboukir (August 1, 1798) speedily decided the coalition pending between England, Austria, the Empire, Portugal, Naples, Russia, and Turkey. The Directory had to make a stand or perish, and with it the Republic. The directors had thought France might retain a monopoly in numbers and in initiative. They soon perceived that enthusiasm is not as great for a war of policy and conquest as for a war of national defence; and the army dwindled, since a country cannot bleed itself to death. The law of conscription was voted on the 6th of September 1798; and the tragedy of Rastadt, where the French commissioners were assassinated, was the opening of a war, desired but ill-prepared for, in which the Directory showed hesitation in strategy and incoherence in tactics, over a disproportionate area in Germany, Switzerland and Italy. Military reverses were inevitable, and responsibility for them could not be shirked. As though shattered by a reverberant echo from the cannon of the Trebia, the Directory crumbled to pieces, succumbing on the 18th of June 1800 beneath the reprobation of the Treihard, Jofre de Sidi, and La Révellière-Lépeaux. A few more military disasters, royalist insurrections in the south, Chouan disturbances in Normandy, Orleanist intrigues and the end came. To soothe the populace and protect the frontier more was required than the resumption, as in all grave crises of the Revolution, of terrorist measures such as forced taxation or the law of hostages; the new Directory, Sieyès presiding, saw that for the indispensable revision of the constitution "a head and a sword" were needed. Moreau being unattainable, Joubert was to be the sword of Sieyès; but, when he was killed at the battle of Novi, the sword of the Revolution fell into the hands of Bonaparte.

Although Brune and Masséna retrieved the fight at Bergen and Zürich, and although the Allies lingered on the frontier as they had done after Valmy, still the fortunes of the Directory were not restored. Success was reserved for Bonaparte, suddenly landing at Fréjus with the prestige of his victories in the East, and now, after Hoche's death, appearing as sole master of the armies. He manoeuvred among the parties as on the 13th Vendémiaire. On the 18th Brumaire of the year VIII. France, for the first time, put the army feet under her feet. By a twofold coup d'état, parliamentary and military, he culled the fruits of the Directory's systematic aggression and unpopularity, and realized the universal desires of the rich bourgeoisie, tired of warfare; of the wretched populace; of landholders, afraid of a return to the old order of things; of royalists, who looked upon Bonaparte as a future monk; of priests and their people, who hoped for an indolent treatment of Catholicism; and finally of the immense majority of the French, who love to be ruled and for long had had no efficient government. There was hardly anyone to defend a liberty which they had never known. France had, indeed, remained monarchist at heart for all her revolutionary appearance; and Bonaparte added a name, though an illusory one, to the series of national or local dictatorships, which, after the departure of the weak Louis XVI., had maintained a sort of informal republican royalty.

On the night of the 19th Brumaire a mere ghost of an Assembly abolished the constitution of the year III., ordained the provisional Consulate, and legalized the coup d'état in favour of Bonaparte. A striking and singular event; for the history of France and a great part of Europe was now for fifteen years to be summed up in the person of a single man (see NAPOLEON).

This night of Brumaire, however, seemed to be a victory for Sieyès rather than for Bonaparte. He it was who originated the project which the legislative commissions, charged with elaborating the new constitution, had to discuss. Bonaparte's cleverness lay in opposing Daunou's plan to that of Sieyès, and in retaining only those portions of both which could serve his ambition. Parliamentary institutions annulled by the complication of three assemblies—the Council of State which drafted bills, the Tribunate which discussed them without voting them, and the Legislative Assembly which voted them without discussing them; popular suffrage, mutilated by the lists of notables (on which the members of the Assemblies were to be chosen by the conservative senate); and the triple executive authority of the consuls, elected for ten years: all these semblances of constitutional authority were adopted by Bonaparte. But he abolished the post of Grand Elector, which Sieyès had reserved for himself, in order to reinforce the real authority of the First Consul;—by leaving the two other consuls, Cambacérès and Lebrun, as well as the Assemblies, equally weak. Thus the aristocratic constitution of Sieyès was transformed into an unwavowed dictatorship, a public ratification of which the First Consul obtained by a third coup d'état from the intimidated and yet reasserted electromen—reassured by his dazzling but unconvincing offers of peace to the victorious Coalition (which repulsed them), by the rapid disarmament of La Vendée, and by the proclamations in which he filled the ears of the infatuated people with the new talk of stability of government, order, justice and moderation. He gave over to the Jacobin and Directory a government once more by a real statesman, that a pilot was at the helm.

Bonaparte had now to rid himself of Sieyès and those republicans who had no desire to hand over the republic to one man, particularly of Moreau and Masséna, his military rivals. The victory of Marengo (June 14, 1800) momentarily in the balance, but secured by Desaix and Kellermann, offered a further opportunity to his jealous ambition by increasing his popularity. The royalist plot of the Rue Saint-Nicais (December 24, 1800) allowed him to make a clean sweep of the democratic republicans, who despite their innocence were deported to Guiana, and to annul Assemblies that were a mere show by making the senate omnipotent in constitutional matters; but it was necessary for him to transform this deceptive truce into the genuine pacification so ardently desired for the last eight years. The treaty of Lunéville, signed in February 1801 with Austria who had never been disarmed by Moreau's victory at Hohenlinden, restored peace to the continent, gave nearly the whole of Italy to France, and permitted Bonaparte to eliminate from the Assemblies all the leaders of the opposition in the discussion of the Civil Code. The Concordat (July 1801), drawn up not in the Church's interest but in that of France, gave in great measure the religious feeling of the country, allowed him to put down the constitutional democratic Church, to rally round him the consciences of the peasants, and above all to deprive the royalists of their best weapon. The "Articles Organiques" hid from the eyes of his companions in arms and councillors a reaction which, in fact if not in law, restored to a submissive Church, despoiled of her revenues, her position as the religion of the state. The peace of Amiens with England (March 1802), of which France's allies, Spain and Holland, paid all the costs, finally gave the peacemaker a pretext for endowing himself with a Consulate, not for ten years but for life, as a recompense from the nation. The Rubicon was crossed on that day: Bonaparte's march to empire began with the constitution of the year X. (August 1802).

Before all things it was now necessary to reorganize France, ravaged as she was by the Revolution, and with her institutions in a state of utter corruption. The touch of the master was at once revealed to all the foreigners who rushed to gaze at the man about whom, after so many cataclysms and strange adventures, Paris, "l'avance lumiére, and all Europe were talking. First of all, Louis XV.'s system of roads was improved and that of Louis XVI.'s canals developed; then industry put its shoulder to the wheel; order and discipline were re-established everywhere, from the frontiers to the capital, and brigandage suppressed; and finally there was Paris, the city of cities! Everything was in process of transformation:
a second Rome was arising, with its forum, its triumphal arches, its shows and parades; and in this new Rome of a new Caesar, France, and luxury, a radiance of art and learning from the age of Pericles, and masterpieces riled from the Netherlands, Italy and Egypt illustrated the consular peace. The Man of Destiny renewed the course of time. He borrowed from the ancien régime its plenipotentiaries; its over-centralized, strictly utilitarian administrative and bureaucratic methods; and afterwards, in order to bring them into line, the subversive pedantic scholasticism of its university. On the basis laid down by the Constituent Assembly and the Convention he constructed or consolidated the funds necessary for national institutions, local governments, a judiciary system, organs of finance, banking, codes, traditions of conscientious well-disciplined labour, and in short all the organization which for three-quarters of a century was to maintain and regulate the concentrated activity of the French nation (see the section Law and Institutions). Peace and order helped to raise the standard of comfort. Provisions, in this Paris which had so often suffered from hunger and thirst, and lacked fire and light, had become cheap and abundant; while trade prosperity and wages ran high. The pomp and luxury of the nouveaux riches were displayed in the salons of the good Josephine, the beautiful Madame Tallien, and the "divine" Juliette Récamier.

But the republicans, and above all the military, saw in all this little but the fetters of system; the wily despotism, the bullying police, the proscription before authority, the sympathy lavished on revolutionaries, the recall of the émigrés, the contempt for the Assemblies, the purification of the Tribunate, the plattitudes of the servile Senate, the silence of the press. In the formidable machinery of state, above all in the creation of the Legion of Honour, the Concordat, and the restoration of indirect taxes, they saw the rout of the Revolution.

But the expulsion of persons like Benjamin Constant and Madame de Staël sufficed to quell this Fronde of the salons. The expedition to San Domingo reduced the republican army to a nullity; war demoralized or scattered the leaders, who were jealous of their "comrade" Bonaparte; and Moreau, the last of his rivals, cleverly compromised in a royalist plot, as Danton had formerly been by Robespierre, disappeared into exile. In contradistinction to this opposition of senators and republican generals, the immense mass of the people received the ineffacable impression of Bonaparte's superiority. No suggestion of the possibility of his death was tolerated, of a crime which might cut short his career. The conspiracy of Cadoudal and Pichegru, after Bonaparte's refusal to give place to Louis XVIII., and the political execution of the duc d'Enghien, provoked an outburst of adulation, of which Bonaparte took advantage to put the crowning touch to his ambitious dream.

The decision of the Senate on the 18th of May 1804, giving him the title of emperor, was the counterblow to the dread he had excited. Thenceforward "the bower of the emperor broke through the thin mask of the First Consul. Never did a harder master ordain more impiously, nor understand better how to command others than himself," as Goethe said, "under his orders men were sure of accomplishing their ends. That is why they rallied round him, as one to inspire them with that kind of certainty." Indeed no man ever concentrated authority to such a point, nor showed mental abilities at all comparable to his: an extraordinary power of work, prodigious memory for details and fine judgment in their selection; together with a luminous decision and a simple and rapid conception, all placed at the disposal of a sovereign will. No head of the state gave expression more imperiously than this Italian to the popular passions of the French of that day: abhorrence for the eminent nobility, fear of the ancien régime, dislike of foreigners, hatred of England, an appetite for conquest evoked by revolutionary propaganda, and the love of glory.

In this Napoleon was a soldier of the people: because of this he judged and ruled his contemporaries. Having seen their actions in the stormy hours of the Revolution, he despised them and looked upon them as incapable of disinterested conduct, conceited, and obsessed by the notion of equality. Hence his colossal egoism, his habitual disregard of others, his jealous passion for power, his impatience of all contradiction, his vain untruthful boasting, his unbridled self-sufficiency and lack of moderation—passions which were gradually to cloud his clear faculty of reasoning. His genius, assisted by the impoverishment of two generations, was like the oak which admits beneath its shade none but the smallest of saplings. With the exception of Talleyrand, after 1808 he would have about him only mediocre people, without initiative, prostrate at the feet of the giant: his tribe of paltry, rapacious and embarrassing Corsicans; his admirably subservient generals; his selfish ministers, docile agents, apprehensive of the future, who for fourteen long years felt a prognostication of defeat and discounted the inevitable catastrophe.

So France had no internal history outside the plans and transformations to which Napoleon subjected the institutions of the Consulate, and the after-effects of his wars. Well knowing that his fortunes rested on the delighted acquiescence of France, he was expected to continue to sincerely favor public opinion according to his pleasure. To his contempt for men he added that of all ideas which might put a bridle on his ambition; and to guard against them, he inaugurated the Golden Age of the police that he might tame every moral force to his hand. Being essentially a man of order, he loathed, as he said, all demagogic action, Jacobinism and visions of liberty, which he desired only for himself. To make his will predominant, he stifled or did violence to that of others, through his bishops, his gendarmes, his university, his press, his catechism. Nourished like Frederick II. and Catherine the Great in 18th-century maxims, neither he nor they would allow any of that ideology to filter through into their rough but regular ordering of mankind. Thus the whole political system, being summed up in the emperor, was bound to share his fall.

Although an enemy of ideologues, in his foreign policy Napoleon was haunted by grandiose visions. A condottiere of the Renaissance in the 19th century, he used France, and all those nations annexed or attracted by the Revolution, to resuscitate the Roman conception of the Empire for his own benefit. On the other hand, he was enslaved by the history and aggressive idealism of the Convention, and of the republican propaganda under the Directory; he was guided by them quite as much as he guided them. Hence the immediate extension given to French activity by his classical Latin spirit; hence also his conquests, leading on from one to another, and instead of being mutually helpful interfering with each other; hence, finally, his not entirely coherent policy, interrupted by hesitation and counter-attractions. This explains the retention of Italy, imposed on the Directory from 1796 onward, followed by his criminal treatment of Venice, the foundation of the Cisalpine republic—a forerunner of future annexations—the restoration of that republic after his return from Egypt, and in view of his as yet inchoate designs, the postponed solution of the Italian problem which the treaty of Luneville had raised.

Napoleon inaugurated the political idea which was to continue its development until his Moscow campaign. Napoleon dreamed as yet only of keeping the duchy of Milan, setting aside Austria, and preparing some new enterprise in the East or in Egypt. The peace of Amiens, which cost him Egypt, could only seem to him a temporary truce; whilst he was gradually extending his authority in Italy, the cradle of his race, by the union of Piedmont, and by his tentative plans regarding Genoa, Parma, Tuscany and Naples. He wanted to make this his Cisalpine Gaul, laying siege to the Roman state on every hand, and preparing in the Concordat for the moral and material servitude of the pope. When he recognized his error in having raised the papacy from decadence by restoring its power over all the churches, he tried in vain to correct it by the Articles Organiques—wanting, like Charlemagne, to be the legal protector of the pope, and eventually master of the Church. To conceal his plan he aroused French colonial aspirations against England, and also
the memory of the spoliations of 1763, exasperating English jealousy of France, whose borders now extended to the Rhine, and laying hands on Hanover, Hamburg and Cuxhaven. By the "Recess" of 1803, which brought to his side Bavaria, Württemberg and Baden, he followed up the overwhelming tide of revolutionary ideas in Germany, to stem which Pitt, back in power, appealed once more to an Anglo-Austro-Russian coalition against this new Charlemagne, who was trying to renew the old Empire, who was mastering France, Italy and Germany; who finally on the 2nd of December 1804 placed the imperial crown upon his head, after receiving the iron crown of the Lombard kings, and made Pius VII. consecrate him in Notre-Dame.

After this, in four campaigns from 1805 to 1809, Napoleon transformed his Carolingian feudal and federal empire into one modelled on the Roman empire. The memories of imperial Rome were for a third time, after Caesar and Charlemagne, to modify the historical evolution of France. Though the vague plan for an invasion of England fell to the ground Ulm and Austerlitz obliterated Trafalgar, and the camp at Boulogne put the best military resources he ever had commanded at Napoleon's disposal.

In the first of these campaigns he swept away the remnants of the old Roman-Germanic empire, and out of its shattered fragments created in southern Germany the vassal states of Bavaria, Baden, Württemberg, Hesse-Darmstadt and Saxony, which he attached to France under the name of the Confederation of the Rhine; but the treaty of Presburg gave France nothing but the danger of a more centralized and less docile Germany. On the other hand, Napoleon's creation of the kingdom of Italy, his annexation of Venetia and her ancient Adriatic empire—wiping out the humiliation of 1797—and the occupation of Ancona, marked a new stage in his progress towards his Roman Empire. His good fortune soon led him from conquest to spoliation, and he complicated his master-idea of the grand empire by his Family Compact; the clan of the Bonapartes invaded European monarchies, wedding with princesses of bloodroyal, and adding kingdom to kingdom. Joseph replaced the dispossessed Bourbons at Naples; Louis was installed on the throne of Holland; Murat became grand-duke of Berg, Jerome son-in-law to the king of Württemberg, Eugene de Beauharnais to the king of Bavaria; while Stéphane de Beauharnais married the son of the grand-duke of Baden.

Meeting with less and less resistance, Napoleon went still further and would tolerate no neutral power. On the 6th of August 1806 he forced the Habsburgs, left with only the crown of Austria, to abdicate their Roman-Germanic title of emperor. Prussia alone remained outside the Confederation of the Rhine, of which Napoleon was Protector, and to further her decision he offered her English Hanover. In a second campaign he destroyed at Jena both the army and the state of Frederick William III., who could not make up his mind between the Napoleonic treaty of Schönbrunn and Russia's counter-proposal at Potsdam (October 14, 1806). The butchery at Eylau and the vengeance taken at Friedland finally ruined Frederick the Great's work, and obliged Russia, the ally of England and Prussia, to allow the latter to be despoiled, and to join Napoleon against the maritime tyranny of the former. After Tilsit, however (July 1807), instead of trying to reconcile Europe to his grandeur, Napoleon had but one thought: to make use of his success to destroy England and complete his Italian dominion. It was from Berlin, on the 21st of November 1806, that he had dated the first decree of a continental blockade, a monstrous conception intended to paralyse his inveterate rival, but which on the contrary caused his own fall by its immediate extension of the empire. To the coalition of the northern powers he added the league of the Baltic and Mediterranean ports, and to the bombardment of Copenhagen by an English fleet he responded by a second decree of blockade, dated from Milan on the 17th of December 1807.

But the application of the Concordat and the taking of Naples led to the first of those struggles with the pope, in which were formulated two antagonistic doctrines: Napoleon declaring himself Roman emperor, and Pius VII. renewing the theocratic affirmations of Gregory VII. The former's Roman ambition was made more and more plainly visible by the occupation of the kingdom of Naples and of the Marches, and the entry of Miollis into Rome; while Junot invaded Portugal, Radet laid hands on the pope himself, and Murat took possession of formerly Roman Spain, whither Joseph was afterwards to be transferred. But Napoleon little knew the flame he was kindling. No more far-seeing than the Directory or the men of the year III., he thought that, with energy and execution, he might succeed in the Peninsula as he had succeeded in Italy in 1796 and 1797, in Egypt, and in Hesse, and that he might cut into Spanish granite as into Italian mosaic or "that big cake, Germany." He stumbled unawares upon the revolt of a proud national spirit, evolved through ten historic centuries; and the trap of Bayonne, together with the enthroning of Joseph Bonaparte, made the contemptible prince of the Asturias the elect of popular sentiment, the representative of religion and country.

Napoleon thought he had Spain within his grasp, and now would prise everything that was slipping from him. The Peninsula became the grave of whole armies and a battlefield for England. Dupont capitulated at Bailen into the hands of Castaños, and Junot at Cintra to Wellesley; while Europe trembled at this first check to the hitherto invincible imperial armies. To reduce Spanish resistance Napoleon had in his turn to come to terms with the tsar Alexander at Erfurt; so that abandoning his designs in the East, he could make the Grand Army evacuate Prussia and return in force to Madrid.

Thus Spain swallowed up the soldiers who were wanted for Napoleon's other fields of battle, and they had to be replaced by forced levies. Europe had only to wait, and it would eventually be found disarmed in face of a last coalition; but Spanish heroism infected Austria, and showed the force of national resistance. The provocations of Talleyrand and England strengthened the illusion: Why should not the Austrians emulate the Spaniards? The campaign of 1809, however, was but a pale copy of the Spanish insurrection. After a short and decisive action in Bavaria, Napoleon opened up the Italian theatre of war for two days' battle at Assling, the stubborn fight at Wagram, the failure of a patriotic insurrection in northern Germany and of the English expedition against Antwerp, the treaty of Vienna (December 14, 1809), with the annexation of the Illyrian provinces, completed the colossal empire. Napoleon profited, in fact, by this campaign which had been planned for his overthrow.

The pope was deported to Savona beneath the eyes of indifferent Europe, and his domains were incorporated in the Empire; the senate's decision on the 17th of February 1810 created the title of king of Rome, and made Rome the capital of Italy. The pope banished, it was now desirable to send away those to whom Italy had been more or less promised. Eugène de Beauharnais, Napoleon's stepson, was transferred to Frankfurt, and Murat carefully watched until the time should come to take him to Russia and instal him as king of Poland. Between 1810 and 1812 Napoleon's divorce of Josephine, and his marriage with Marie Louise of Austria, followed by the birth of the king of Rome, gave a brilliant light upon his future policy. He emancipated himself from a federation in which his brothers were not sufficiently docile; he gradually withdrew power from them; he concentrated all his affection and ambition on the son who was the guarantee of the continuance of his dynasty. This was the apotheosis of his reign.

But undermining forces were already at work: the faults inherent in his unwieldy achievement. England, his chief enemy, was persistently active; and rebellion both of the governing and the governed broke out everywhere. Napoleon felt his impotence in coping with the Spanish insurrection, which he undertook, while yet unable to suppress it altogether. Men like Stein, Hardenberg and Schamhurst were secretly preparing Prussia's retaliation. Napoleon's material omnipotence could not stand...
against the moral force of the pope, a prisoner at Fontainebleau; and this he did not realize. The alliance arranged at Tilsit was seriously shaken by the Austrian marriage, the threat of a Polish restoration, and the unfriendly policy of Napoleon at Constantinople. The very persons whom he had placed in power were countering his plans: after four years' experience Napoleon found himself obliged to treat his Corsican dynasties like those of the ancien régime, and all his relations were betraying him. Caroline conspired against her brother and against her husband; the hypochondriacal Louis, now Dutch in his sympathies, found the supervision of the blockade taken from him, and also the defense of the Scheldt, which he had refused to ensure; Jerome, idling in his harem, lost that of the North Sea shores; and Joseph, who was attempting the moral conquest of Spain, was continually insulted at Madrid. The very nature of things was against the new dynasties, as it had been against the old.

After national insurrections and family recriminations came treachery from Napoleon's ministers. Talleyrand betrayed his designs to Metternich, and had to be dismissed; Bourrienne corresponded with Austria in 1809 and 1810, entered into a commerce of villainy with M. Males, which was discovered at Smolensk, while Bourrienne was convicted of peculation. By a natural consequence of the spirit of conquest he had aroused, all these parvenus, having tasted victory, dreamed of sovereign power: Bernadotte, who had helped him to the Consulate, played Napoleon false to win the crown of Sweden; Soult, like Murat, coveted the Spanish throne after that of Portugal, thus anticipating the treason of 1813 and the defection of 1814; many persons hoped for "an accident" which might resemble the tragic end of Alexander and of Caesar. The country itself, besides, though flattered by victories, was tired of self-sacrifice. It had become satiated; "the cry of the mothers rose threateningly" against "the Ogre," and his intolerable imposition of wholesale conscription. The soldiers themselves, discontented after Austerlitz, cried out for peace after Eylau. Finally, amidst profound silence from the press and the Assemblies, a protest was raised against imperial despotism by the literary world, against the excommunicated sovereign by Catholicism, and against the author of the continental blockade by the discontented bourgeoisie, ruined by the crisis of 1811.

Napoleon himself was no longer the General Bonaparte of his campaign in Italy. He was already showing signs of physical decay; the Roman medallion profile had coarsened, the obese body was often lumpy. Mental degeneration, too, betrayed itself in an unwonted irresolution. At Eylau, at Wagram, and later at Waterloo, his method of acting by enormous masses of infantry and cavalry, in a mad passion for conquest, and his misuse of his military resources, were all signs of his moral and technical decadence; and this at the precise moment when, instead of the armies and governments of the old system, which had hitherto reigned supreme, the nations themselves were rising against France, and the events of 1792 were being avenged upon her. The three campaigns of two years brought the final catastrophe.

Napoleon had hardly succeeded in putting down the revolt in Germany when he faced the most desperate European insurrection against the ruinous tyranny of the continental blockade. To put a stop to this, to ensure his own access to the Mediterranean and exclude his chief rival, Napoleon made a desperate effort in 1812 against a country as invincible as Spain. Despite his victorious advance, the taking of Smolensk, the victory on the Moskwa, and the entry into Moscow, he was vanquished by Russian patriotim and religious fervour, by the country and the climate, and by Alexander's refusal to make terms. After this came the lamentable retreat, while all Europe was concentrating against him. Pushed back, as he had been in Spain, from bastion to bastion, after the action on the Beresina, Napoleon had to fall back upon the frontiers of 1809, and then—having refused the peace offered him by Austria at the congress of Prague, from a dread of losing Italy, where each of his victories had marked a stage in the accomplishment of his dream—on those of 1805, despite Lützen and Bautzen, and on those of 1802 after his defeat at Leipzig, where Bernadotte turned upon him, Moreau figured among the Allies, and the Saxons and Bavarians forsok him. Following his retreat from Russia came his retreat from Germany. After the loss of Spain, reconquered by Wellington, the rising in Holland preliminary to the invasion and the manifesto of Frankfort which proclaimed it, he had to fall back upon the frontiers of 1795; and then later was driven yet farther back upon those of 1792, despite the wonderful campaign of 1814 against the invaders, in which the old Bonaparte of 1796 seemed to have returned. Paris capitulated on the 30th of March, and the "Delenda Carthago," pronounced against England, was spoken of Napoleon. The great empire of East and West fell in ruins with the emperor's abdication at Fontainebleau.

The military struggle ended, the political struggle began. How was France to be governed? The Allies had decided on the eviction of Napoleon at the Congress of Châtillon; and the precarious nature of the Bonapartist monopoly in France itself was made manifest by the exploit of General Males, which had almost succeeded during the Russian campaign, and by Laine's demand for free exercise of political rights, when Napoleon made a last appeal to the Legislative Assembly for support. The deflection of the military and civil aristocracy, which brought about Napoleon's abdication, the refusal of a regency, and the failure of Bernadotte, who wished to resuscitate the Consulate, enabled Talleyrand, vice-president of the senate and desirous of power, to persuade the Allies to accept the Bourbon solution of the difficulty. The declaration of St Ouen (May 2, 1814) indicated that the new monarchy was only accepted upon conditions. After Napoleon's abdication, 2nd exile to the island of Elba, came the Revolution's abdication of her conquers: the first treaty of Paris (May 30th) confirmed France's renunciation of Belgium and the left bank of the Rhine, and her return within her pre-revolutionary frontiers, save for some slight rectifications.

After the scourge of war, the horrors of conscription, and the despotism which had destroyed glory, every one seemed to wish at once the return of the Bourbons, which atoned for humiliations by restoring liberty. But questions of form, which aroused questions of sentiment, speedily led to grave dissensions. The hurried armistice of the 23rd of April, by which the comte d'Artois delivered over disarmed France to her conquerors; Louis XVIII's excessive gratitude to the prince regent of England; the return of the émigrés; the declaration of St Ouen, dated from the sixteenth year of the new reign; the charter of June 4th, "concédée et octroyée," maintaining the effete doctrine of legitimacy in a country permeated with the idea of national sovereignty; the slightings put upon the army; the obligatory processions ordered by Comte Beugnot, prefect of police; all this provoked a conflict not only between two theories of government but between two groups of men and of interests. An avowedly imperialist party was soon again formed, a centre of heated opposition to the royalist party; and neither Baron Louis' excellent finance, nor the peace, nor the charter of June 4th—which despite the promise of the émigrés caused all the civil gains of the Revolution—prevented the man who was its incarnation from seizing an opportunity to bring about another military coup d'état. Having landed in the Bay of Jouan on the 1st of March, on the 20th Napoleon re-entered the Tuileries in triumph, while Louis XVIII fled to Ghent. By the Acte additionnel of the 22nd of April he induced Carnot and Fouché—the last of the Jacobins—and the heads of the Liberal opposition, Benjamin Constant and La Fayette, to side with him against the hostile Powers of Europe, occupied in dividing the spoils at Vienna. He proclaimed his intention of founding a new democratic empire; and French policy was thus given another illusion, which was to be exploited with fatal success by Napoleon's namesake. But the cannon of Waterloo ended this adventure (June 18, 1815), and, thanks to Fouché's treachery, the triumphal progress of
FRANCE

HISTORY

864

Milan, Rome, Naples, Vienna, Berlin, and even of Moscow, was to end at St. Helena.

The consequences of the Hundred Days were very serious; France was embroiled with all Europe, though Talleyrand’s clever diplomacy had succeeded in causing division over Saxony and Poland by the secret Austro-Anglo-

French alliance of the 3rd of January 1815, and the Coalition destroyed both France’s political independence and national integrity by the treaty of peace of November 20th: she found herself far weaker than before the Revolution, and in the power of the European Alliance. The Hundred Days divided the nation itself into two irreconcilable parties: one ultra-royalist, eager for vengeance and retaliation, refusing to accept the Charter; the other imperialist, composed of Bonapartist and Republicans, incensed by their defeat—of whom Béranger was the Tyrtaeus—both parties equally revolutionary and equally obstinate. Louis XVIII., urged by his more fervent supporters towards the ancien régime, gave his policy an exactly contrary direction; he had common-sense enough to maintain the Empire’s legal and administrative tradition, accepting its institutions of the Legion of Honour, the Bank, the University, and the imperial nobility—modifying only formally certain rights and the conscription, since these had aroused the nation against Napoleon. He even went so far as to accept advice from the imperial ministers Talleyrand and Fouché. Finally, as the chief political organization had become thoroughly demoralized, he imported into France the entire constitutional system of England, with its three powers, king, upper hereditary chamber, and lower elected chamber; with its plutocratic electorate, and even with details like the speech from the throne, the debate on the address, &c. This meant importing also difficulties such as ministerial responsibility, as well as electoral and press legislation.

Louis XVIII., taught by time and misfortune, wished not to reign over two parties exasperated by contrary passions and desires; but his dynasty was from the outset implicated in the struggle, which was to be fatal to it, between old France and revolutionary France. Anti-monarchical, liberal and anti-clerical France at once recommenced its revolutionary work; the whole 19th century was to be filled with great spasmodic upheavals, and Louis XVIII. was soon overwhelmed by the White Terrorists of 1815.

Vindictive sentences against men like Ney and Labédoyère were followed by violent and unpunished action by the White Terror, which in the south renewed the horrors of St. Bartholomew and the September massacres. The elections of August 14, 1815, made under the influence of these royalist and religious passions, sent the “Chambre introuvable” to Paris, an unforeseen revival of the ancien régime. Neither the substitution of the duc de Richelieu’s ministry for that of Talleyrand and Fouché, nor a whole series of repressive laws in violation of the charter, were successful in satisfying its tyrannical loyalty, and Louis XVIII. needed something like a coup d’état, in September 1816, to rid himself of the “ultras.”

He succeeded fairly well in quieting the opposition between the dynasty and the constitution, until a reaction took place between 1820 and 1822. State departments worked regularly and well, under the direction of Decazes, Lainé, De Serre and Pasquier, power alternating between two great well-disciplined parties almost in the English fashion, and many useful measures were passed: the reconstruction of finance stipulated for as a condition of evacuation of territory occupied by foreign troops; the electoral law of February 5, 1817, which, by means of direct election and a qualification of three hundred francs, renewed the ponderance of the bourgeoisie; the Gouvion St-Cyr law of 1818, which for half a century based the recruiting of the French army on the national principle of conscription; and in 1819, after Richelieu’s dismissal, liberal regulations for the press under control of a commission. But the advance of the Liberal movement, and the election of the generals—Foy, Lamargue, Lafayette and of Manuel, excited the “ultras” and caused the dismissal of Richelieu; while that of the constitutional bishop Grégoire led to the modification in a reactionary direction of the electoral law of 1817. The assassination of the duc de Berry, second son of the comte d’Artois (attributed to the influence of Liberal ideas), caused the downfall of Decazes, and caused the king—more weak and selfish than ever—to override the charter and embark upon a reactionary path. After 1820, Madame du Cayla, a trusted agent of the ultra-royalist party, gained great influence over the king; and M. de Villelle, its leader, supported by the king’s brother, soon eliminated the Right Centre by the dismissal of the duc de Richelieu, who had been recalled to tide over the crisis—just as the fall of M. Decazes had signalized the defeat of the Left Centre (December 15, 1821)—and moderate policy thus received an irreparable blow.

Thenceforward the government of M. de Villelle—a clever statesman, but tied to his party—did nothing for six years but promulgate a long series of measures against Liberalism and the social work of the Revolution; to retain power it had to yield to the impatience of the comte d’Artois and the majority. The suspension of individual liberty, the re-establishment of the censorship; the electoral right of the “double vote,” favouring taxation of the most oppressive kind; and the handing over of education to the clergy: these were the first achievements of this anti-revolutionary ministry. The Spanish expedition, in which M. de Villelle’s hand was forced by Montmorency and Chateaubriand, was the united work of the association of Catholic zealots known as the Congregation and of the autocratic powers of the Grand Alliance; it was responded to—as at Naples and in Spain—by secret Carbonari societies, and by severely repressed military conspiracies. Politics now bore the double imprint of two rival powers: the Congregation and Carbonarism. By 1824, nevertheless, the dynasty seemed firm—the Spanish War had reconciled the army, by giving back military prestige; the Liberal opposition had been decimated; revolutionary conspiracies discouraged; and the increase of public credit and material prosperity pleased the whole nation, as was proved by the “Chambre retrouvée” of 1824. The law of septennial elections tried to preserve national life by suspending any legal or regular manifestation by the nation for seven years.

It was the monarchy which next became revolutionary, on the accession of Charles X. (September 16, 1824). This inconsiderate prince soon exhausted his popularity, and remained the fanatical head of those émigrés who had learnt nothing and forgotten nothing. While the opposition became conservative as regards the Charter and French liberties, the king and the clerical party surrounding him challenged the spirit of modern France by a law against sacrilege, by a bill for re-establishing the right of primogeniture, by an indemnity of a milliard francs, which looked like compensation given to the émigrés, and finally by the “loi de liberté d’âmour” against the press. The challenge was so definite that in 1826 the Chamber of Peers and the Academy had to give the Villelle ministry a lesson in Liberalism, for having lent itself to this ancien régime reaction by its weakness and its party-promises. The elections de couleur et de concurrence of January 1827 gave the Left a majority, and the resultant short-lived Martignac ministry tried to reverse the Right Centre which had always supported Richelieu and Decazes (January 1828). Martignac’s accession to power, however, had only meant personal concessions from Charles X., not any concession of principle: he supported his ministry but was no real stand-by. The Liberals, on the other hand, made bargains for supporting the moderate royalists, and Charles X. profited by this to form a fighting ministry in conjunction with the prince de Polignac, one of the émigrés, an ignorant and visionary person, and the comte de Bourmont, the traitor of Waterloo. Despite all kinds of warnings, the former tried by a coup d’état to put into practice his theories of the supremacy of the royal prerogative; and the battle of Navarino, the French occupation of the Morea, and the Algerian expedition could not make the nation forget this conflict at home. The united opposition of monarchist
Liberal and imperialist republicans responded by legal resistance, then by a popular

coup d'etat, to the ordinances of July 1830, which dissolved the intractable Chamber, eli-

minated licensed dealers from the electoral list, and muzzled the press. After fighting for three days against

the troops feebly led by the Marmont of 1814, the

workmen, driven to the barricades by the deliberate closing of

Liberal workshops, gained the victory, and sent the white flag

of the Bourbons on the road to exile.

The rapid success of the "Three Glorious Days" ("les Trois Glorieuses"), as the July Days were called, put the leaders of

the opposition in a compromising position.

While they had contented themselves with words, the small Republican-Imperialist party, aided by the

almost entire absence of the army and police, and by the conversion, which the narrow, winding, paved streets of those

times offered for fighting, had determined upon the revolution and brought it to pass. But the Republican party, which desired to

re-establish the Republic of 1793, recruited chiefly from among the students and workmen, and led by Godefroy Cavaignac,

the son of a Conventionalist, and by the chemist Raspail, had no hold on the departments nor on the dominating opinion in

Paris. Consequently this premature attempt was promptly seized upon by the Liberal bourgeoisie and turned to the advantage

of the Orleanist party, which had been secretly organized since 1829 under the leadership of Thiers, with the National as its

organ. Before the struggle was yet over, Benjamin Constant, Casimir Pérèr, Lafitte, and Odillon Barrot had gone to fetch

the duché of Orleans from Neuchâtel, and on receiving his promise to defend the Charter and the tricolour flag, installed him at the

Palais Bourbon as lieutenant-general of the realm, while La Fayette and the Republicans established themselves at the Hôtel de Ville.

An armed conflict between the two governments was imminent, when Lafayette, by giving his support to

Louis Philippe, decided matters in his favour.

In order to avoid a recurrence of the difficulties which had arisen with the Bourbons, the following preliminary conditions were

imposed on the king: the recognition of the supremacy of the people by the title of "king of the French by the grace of God

and the will of the people," the responsibility of ministers, the suppression of hereditary succession to the Chamber of Peers,

now reduced to the rank of a council of officials, the suppression of article 14 of the charter which had enabled Charles X.

to suppress the last liberties of the French, and the payment of the press.

The qualification for electors was lowered from 300 to 200 francs, and that for eligibility from 1000 to 500 francs, and the age to 25 and 30 instead of 30 and 40; finally, Catholicism lost its privileged position as the state religion. The bourgeoisie National Guard was made the guardian of the Charter.

The liberal ideas of the son of Philippe Égalité, the part he had played at Valmy and Jemappes, his gracious manner and his domestic

virtues, all united in winning Louis Philippe the good opinion of the public.

He now believed, as did indeed the great majority of the electorate, that the revolution of 1830 had changed nothing but

the head of the state. But in reality the July monarchy was affected by a fundamental weakness. It sought to

found its authority on the monarchies, and the legitimacy of the press.

He now believed, as did indeed the great majority of the electorate, that the revolution of 1830 had changed nothing but

the head of the state. But in reality the July monarchy was affected by a fundamental weakness. It sought to

found its authority on the monarchies, and the legitimacy of the press.
and legislative repression, consisting in the laws of September, which, when to mere ridicule had succeeded acts of violence, such as that of Fieschi (July 28th, 1835), aimed at facilitating the condemnation of political offenders and at intimidating the party. The party of "movement" was vanquished.

But the July Government, born as it was of a popular movement, had to make concessions to popular demands. Casimir Pétier had carried a law dealing with municipal organization, which made the municipal councils elective, as they had been before the year VIII.; and in 1835 Guizot had completed it by making the conseils généraux also elective. In the same year the law dealing with primary instruction had also shown the mark of new ideas. But now that the bourgeoisie was raised to power it did not prove itself any more liberal than the aristocracy of birth and fortune in dealing with educational, fiscal and industrial questions. In spite of the increase of riches, the bourgeois régime maintained a fiscal and social legislation which, while it assured to the middle class certainty and permanence of benefits, left the labouring masses poor, ignorant, and in a state of incessant agitation.

The Orleanists, who had been unanimous in supporting the king, disagreed, after their victory, as to what powers he was to be given. The Left Centre, led by Thiers, held that he should reign but not rule; on the other hand, the Centre led by Guizot would admit him to an active part in the government; and the third party (tiers-parti) wavered between these two. And so between 1836 and 1840, as the struggle against the king's claim to govern passed from the sphere of outside discussion into parliament, we see the rise of a bourgeois socialist party, side by side with the now dwindling republican party. It no longer confined its demands to universal suffrage, on the principle of the legitimate representation of all interests, or in the name of justice. Led by Saint-Simon, Fourier, P. Leroux and Lamennais, it aimed at realizing a better social organization for and by means of the state. But the question was by what means this was to be accomplished. The secret societies, under the influence of Blanqui and Barbès, two revolutionaries who had revived the traditions of Babeuf, were not willing to wait for the complete education of the masses, necessarily a long process. On the 12th of May 1839 the Société des Saisons made an attempt to overthrow the bourgeoisie by force, but was defeated. Democrats like Louis Blanc, Ledru-Rollin and Lamennais continued to repeat in support of the wisdom of universal suffrage the profession of faith: not the Rule of One. And finally this republican doctrine, which, moreover, was confused, was still further complicated by a kind of mysticism which aimed at reconciling the most extreme differences of belief, the Catholicism of Buchez, the Bonapartism of Cornemen, and the humanitarianism of the cosmopolitans. It was in vain that Auguste Comte, Michelet and Quinet denounced this vague humanitarian mysticism and the pseudoliberalism of the Church. The movement had now begun.

At first these moderate republicans, radical or communist, formed only imperceptible groups. Among the peasant classes, and even in the industrial centres, warlike passions were still rife. Louis Philippe tried to find an outlet for them in the Algerian war, and later by the revival of the Napoleonic legend, which was held to be no longer dangerous, since the death of the Duke of Reichstadt in 1832. It was vehemently recalled by Thiers' History of the Consulate and Empire, by artists and poets, in spite of the prophecies of Lamartine, and by the solemn translation of Napoleon I.'s ashes in 1840 to the Invalides at Paris.

All theories require to be based on practice, especially those which involve force. Now Louis Philippe, though as active as his predecessors had been slothful, was the least warlike of men. His only wish was to govern personally, as George III. and George IV. of England had done, especially in foreign affairs, while at home was being waged the great duel between Thiers and Guizot, with Molfé as intermediary. Thiers, head of the cabinet of the 22nd of February 1836, an astute man but not pliant enough to please the king, fell after a few months, in consequence of his attempt to stop the Carlist civil war in Spain, and to support the constitutional government of Queen Isabel. Louis Philippe hoped that, by calling upon Molfé to form a ministry, he would be better able to make his personal authority felt. From 1837 to 1839 Molfé aroused opposition on all hands; this was emphasized by the refusal of the Chambers to vote one of those endowments which the king was continually asking them to grant for his children, by two dissolutions of the Chambers, and finally by the Strasbourg affair and the stormy trial of Louis Napoleon, son of the former king of Holland (1836-1837). At the elections of 1839 Molfé was defeated by Thiers, Guizot and Barrot, who had combined to oppose the tyranny of the "Château," and after a long ministerial crisis was replaced by Thiers (March 1, 1840). But the latter was too much in favour of war to please the king, who was strongly disposed towards peace and an alliance with Great Britain, and consequently fell at the time of the Egyptian question, when, in answer to the treaty of London concluded behind his back by Nicholas I. and Palmerston on the 15th of July 1840, he fortified Paris and proclaimed his intention to give armed support to Mehemet Ali, the ally of France (see MEHEMET ALI). But the violence of popular Chauvinism and the renewed attempt of Louis Napoleon at Bouligne proved to the minister the price of two millions. It is possible that in the long run their policy tends to turn a peaceful attitude into a warlike one, and to strengthen the absolutist idea.

In spite of all, from 1840 to 1848 Louis Philippe still further extended his activity in foreign affairs, thus bringing himself into still greater prominence, though he was already frequently held responsible for failures in foreign politics and unpopular measures in home affairs. The catchword of Guizot, who was now his minister, was: Peace and no reforms. With the exception of the law of 1842 concerning the railways, not a single measure of importance was proposed by the ministry. France lived under a régime of general corruption: parliamentary corruption, due to the illegal conduct of the deputies, consisting of slavish or venal officials; electoral corruption, effected by the purchase of the 200,000 electors constituting the "pays légal," who were bribed by the advantages of power; and moral corruption, due to the reign of the plutocracy, the bourgeoisie, a hard-working, educated and honourable class, it is true, but insolent, like all newly enriched parvenus in the presence of other aristocracies, and with unyielding selfishness maintaining an attitude of suspicion towards the public, which they did not need to feel, and from whom they did not feel themselves to have anything in common. This led to a slackening in political life, a sort of exhaustion of interest throughout the country, an excessive devotion to material prosperity. Under a superficial appearance of calm a tempest was brewing, of which the industrial writings of Balzac, Eugène Sue, Lamartine, H. Heine, Vigny, Montalembert and Toqueville were the premonitions. But it was in vain that they denounced this supremacy of the bourgeoisie, relying on its two main supports, the suffrage based on a property qualification and the National Guard, for its rallying-cry was the "Enrichissez-vous" of Guizot, and its excessive materialism gained a sinister distinction from scandals connected with the ministers Teste and Cubières, and such mysterious crimes as that of Choiseul-Praslin.1

1 Charles Laure Hugues Théobald, duc de Choiseul-Praslin (1805-1847), was deputy in 1839, created a peer of France in 1840. He had a daughter, who in 1847 married a dauphin d'Orléans, the duchess was stabbed to death, with more than thirty wounds, in her room. The duchess was arrested on the 20th and imprisoned in the Luxembourg, where he died of poison, self-administered on the 24th of August 1847. It was, however, popularly believed that the government had smuggled him out of the country and that he was living under a feigned name in England.
It was in vain that beneath the inflated haute bourgeoisie which speculated in railways and solidly supported the Church, behind the shopkeeper clique who still remained Voltairean, who enviously applauded the pamphlets of Cornavin on the luxury of the court, and who were bitterly satirized by the pen of Daumier and Gavarni, did the thinkers give voice to the mutterings of an immense industrial proletariat, which were re-echoing throughout the whole of western Europe.

In face of this tragic contrast Guizot remained unmoved, blinded by the superficial brilliance of apparent success and prosperity. He adorned by flights of eloquence his invariable theme: no new laws, no reforms, no foreign complications, the policy of material interests. He preserved his holding attitude towards Great Britain in the affair of the right of search in 1841, and in the affair of the missionary Pritchard at Tahiti (1843-1845). And when the marriage of the duc de Montpensier with a Spanish infanta in 1840 had broken this entente cordiale to which he clung, it was only to yield in turn to Metternich, when he took possession of Cracow, the last remnant of Poland, to protect the Sonderbund in Switzerland, to discourage the Liberal ardour of Pius IX., and to hasten the education of France by the ascension of the clergy. Still further, when, following the elections of 1846, he refused the demands of the Opposition formed by a coalition of the Left Centre and the Radical party for parliamentary and electoral reform, which would have excluded the officials from the Chambers, reduced the electoral qualification to 100 francs, and added to the number of the electors the capacitaux whose competence was guaranteed by their education. For Guizot the whole country was represented by the "pays légal," consisting of the king, the ministers, the deputies and the electors. When the Opposition appealed to the country, he flung down a disdainful challenge to what "les brouillons et les badauds apppellent le peuple." The challenge was taken up by all the parties of the Opposition in the campaign of the banquet got up somewhat artificially in 1847 in favour of the extension of the franchise. The monarchy had arrived at such a state of weakness and corruption that a determined minority was sufficient to overthrow it. The prohibition of a last banquet in Paris precipitated the catastrophe. The monarchy was not for ever: it had to overcome its adversaries. The provisional government collapsed on the 24th of February 1848 to the astonishment of all.

The industrial population of the faubourgs on its way towards the centre of the town was welcomed by the National Guard, among cries of "Vive la réforme." Barricades were raised after the unfortunate incident of the firing on the crowd in the Boulevard des Capucines. On the 23rd Guizot's cabinet resigned, abandoned by the petite bourgeoisie, on whose support they thought they could depend. The heads of the Left Centre and the dynamic Left, Molé and Thiers, declined the offered leadership. Odillon Barrot accepted it, and Bugeaud, commander-in-chief of the first military division, who had begun to attack the barricades, was recalled. But it was too late. In face of the insurrection which had now taken possession of the whole capital, Louis Philippe decided to abdicate in favour of his grandson, the comte de Paris. But it was too late also to be content with the regency of the duchess of Orleans. It was now the turn of the Republic, and it was proclaimed by Lamartine in the name of the provisional government elected by the Chamber under the pressure of the mob.

This provisional government with Dupont de l'Eure as its president, consisted of Lamartine for foreign affairs, Crémieux for justice, Ledru-Rollin for the interior, Carnot for public instruction, Gondchaux for finance, Arago for the navy, and Bedeau for war. Garnier-Pagès was mayor of Paris. But, as in 1830, the republican-socialist party had set up a rival government at the Hôtel de Ville, including L. Blanc, A. Marrast, Flocon, and the workman Albert, which bid fair to involve discord and civil war. But this time the Palais Bourbon was not victorious over the Hôtel de Ville. It had to consent to a fusion of the two bodies, in which, however, the predominating elements were the moderate Republicans. It was doubtful what would eventually be the policy of the new government. One party, seeing that in spite of the changes in the last sixty years of all political institutions, the position of the people had not been improved, demanded a reform of society itself, the abolition of the privileged position of property, the only obstacle to equality, and as an emblem hoisted the red flag. The other party wished to maintain society on the basis of its ancient institutions, and rallied round the tricolour.

The first collision took place as to the form which the revolution of 1848 was to take. Were they to remain faithful to their original principles, as Lamartine wished, and accept the decision of the country as supreme, or were they, as the revolutionaries under Ledru-Rollin claimed, to declare the republic of Paris superior to the universal suffrage of an insufficiently educated people? On the 5th of March the government, under the pressure of the Parisian clubs, decided in favour of an immediate reference to the people, and direct universal suffrage, and adjourned it till the 26th of April. In this fateful and unexpected decision, which instead of adding to the electorate the educated classes, refused by Guizot, admitted to it the unemployed, the Communists, the Socialists, the Assembly of the 4th of May 1848. The provisional government having resigned, the republican and anti-socialist majority on the 9th of May entrusted the supreme power to an executive commission consisting of five members: Arago, Marie, Garnier-Pagès, Lamartine and Ledru-Rollin. But the spell was already broken. This revolution which had been peacefully effected with the most generous aspirations, in the hope of abolishing poverty by organizing industry on other bases than those of competition and capitalism, and which had at once aroused the fraternal sympathy of the nations, was doomed to be abortive.

The result of the general election, the return of a constituent assembly predominantly moderate if not monarchical, dashed the hopes of those who had looked for the establishment, by a peaceful revolution, of their ideal socialist state; but they were not prepared to yield without a struggle, and in Paris itself they commanded a formidable force. In spite of the preponderance of the "tricolour" party in the provisional government, so long as the voice of France had not spoken, the Socialists, supported by the Parisian proletariat, had exercised an influence on policy out of all proportion to their relative numbers or personal weight. By the decree of the 24th of February the provisional government had solemnly accepted the principle of the "right to work," and decided to establish "national workshops" for the unemployed; at the same time a sort of industrial parliament was established at the Luxembourg, under the presidency of Louis Blanc, with the object of preparing a scheme for the organization of labour; and, lastly, by the decree of the 8th of March the property qualification for enrolment in the National Guard had been abolished and the workmen were supplied with arms. The Socialists thus formed, in some sort, a state within the state, with a government, an organization and an armed force.

In the circumstances a conflict was inevitable; and on the 15th of May an armed mob, headed by Raspail, Blanqui and Barbes, and assisted by the proletariat Guard, attempted to dislodge the Assembly. The National Guard, the courageous battalions of the National Guard; but the situation none the less remained highly critical. The national workshops were producing the results that might have been foreseen. It was impossible to provide remunerative work even for the genuine unemployed, and of the thousands who applied the greater number were employed in perfectly useless digging and reeling; soon even this expedient failed, and those for whom work could not be invented were given a half wage of 1 franc a day. Even this pitiful dole, with no obligation to work, proved attractive, and all over France workmen threw up their jobs and streamed to Paris, where they swelled the ranks of the army under the red flag. It was soon clear that the continuance of this experiment would mean financial ruin; it had been proved by the émeute of the 15th of May that it constituted a perpetual menace.
FRANCE [HISTORY]

For three years there went on an indecisive struggle between the heterogeneous Assembly and the prince who was silently awaiting his opportunity. He chose as his ministers from the little groups towards republicanism, for preference Orleanists, the chief of whom was Odilon Barrot. In order to strengthen his position, he endeavoured to conciliate the revolutionary parties, without committing himself to any of them. The chief instance of this was the expedition to Rome, voted by the Catholics with the object of restoring the papacy, which had been driven out by Garibaldi and Mazzini. The prince-president was also in favour of it, as beginning the work of European renovation and reconstruction which he already looked upon as his mission. General Oudinot’s entry into Rome provoked in Paris a foolish insurrection in favour of the Roman republic, that of the Château d’Eau, which was crushed on the 13th of June 1849. On the other hand, when Pius IX., though only just restored, began to yield to the general movement of reaction, the president demanded that he should set up a Liberal government. The pope’s dilatory reply having been accepted by his ministry, the president replaced it on the 1st of November by the Fould-Rouher cabinet.

This looked like a declaration of war against the Catholic and monarchist majority in the Legislative Assembly which had been elected on the 28th of May in a moment of panic. But the prince-president again pretended to be playing the game of the Orleanists, as he had done in 1830 against the Central Assembly. The complementary elections of March and April 1849 having resulted in an unexpected victory for the advanced republicans, which struck terror into the reactionary leaders, Thiers, Berryer and Montalembert, the president gave his countersign to a clerical campaign against the republicans at home. The Church, which had failed in its attempts to gain control of the university under Louis XVIII. and Charles X., aimed at setting up a rival establishment of its own. The “Law of Follaux” of the 15th of March 1839, under the pretext of establishing the liberty of instruction promised by the charter, again placed the teaching of the university under the direction of the Catholic Church, as a measure of social safety, and, by the facilities which it granted to the Church for propagating teaching in harmony with its own dogmas, succeeded in obstructing for half a century the work of intellectual enfranchisement effected by the men of the 18th century and of the Revolution. The electoral law of the 31st of May was another class law directed against subservient ideas. It required as a proof of three years’ domicile the entries in the record of direct taxes, thus cutting down universal suffrage by taking away the vote from the industrial population, which was not as a rule stationary. The law of the 16th of July aggravated the severity of the press restrictions by re-establishing the “caution money” (cautionnement) deposited by proprietors and editors of papers with the government as a guarantee of good behaviour. Finally, a skilful interpretation of the law on clubs and political societies suppressed about this time all the Republican societies. It was now their turn to be crushed like the Socialists.

But the president had only joined in Montalembert’s cry of “Down with the Republicans!” in the hope of effecting a revision of the constitution without having recourse to a coup d’état. His concessions only increased the boldness of the monarchists; while they had only accepted Louis Napoleon as president in opposition to the Republic and as a step in the direction of the monarchy. A conflict was now inevitable between his personal policy and the majority of the Chamber, who were, moreover, divided into legitimists and Orleanists, in spite of the death of Louis Philippe in August 1830. Louis Napoleon skilfully exploited their projects for a restoration of the monarchy, which he knew to be unpopular in the country, and which gave him the opportunity of furthering his own personal ambition. From the 8th of August to the 12th of November 1839 he went about France stating the case for a revision of the constitution in speeches which he varied according to each place; he held

to the state; and the government decided to end it. The method chosen was scarcely a happy one. On the 21st of June M. de Fallet-de-Foix, the head of the parliamentary commission on labour that the workmen should be discharged within three days and such as were able-bodied should be forced to enlist.

A furious insurrection at once broke out. Throughout the whole of the 24th, 25th and 26th of June, the eastern industrial quarter of Paris, led by Pujol, carried on a furious struggle against the western quarter, led by Cavaignac, who had been appointed dictator. Vanquished and decimated, first by fighting and afterwards by deportation, the socialist party was crushed. But they dragged down the Republic in their ruin. This had already become unpopular with the peasants, exasperated by the new land tax of 45 centimes imposed in order to fill the empty treasury, and with the bourgeoisie, in terror of the power of the revolutionary clubs and hard hit by the stagnation of business. By the “massacres” of the June Days the working classes were also alienated from it; and abiding fear of the “Reds” did the rest. “France,” wrote the duke of Wellington at this time, “needs a Napoleon! I cannot see him... Where is he?”

France indeed needed, or thought she needed, a Napoleon, and the demand was soon to be supplied. The granting of universal suffrage to a society with Imperialist sympathies, and unfruitful to reconcile the principles of order with the consequences of liberty, was indeed beyond the power of the political balance France was so radically changed, to prove a formidable instrument of reaction; and this was proved by the election of the president of the Republic. On the 4th of November 1848 was promulgated the new constitution, obviously the work of inexperienced hands, proclaiming a democratic republic, direct universal suffrage and the separation of powers; there was to be a single permanent assembly of 750 members elected for a term of three years by the scrutin de liste, which was to vote on the executive prepared by a council of state elected by the Assembly for six years; the executive power was delegated to a president elected for four years by direct universal suffrage, i.e. on a broader basis than that of the chamber, and not eligible for re-election; he was to choose his ministers, who, like him, would be responsible. Finally, all revision was made impossible since it involved obtaining three times in succession a majority of three-quarters of the deputies in a special assembly. It was in vain that M. Grévy, in the name of those who perceived the obvious and inevitable risk of creating, under the name of a president, a monarch and more than a king, proposed that the head of the state should be no more than a removable president of the ministerial council. Lamartine, thinking that he was sure to be the choice of the electors under universal suffrage, won over the support of the Chamber, which did not even take the precaution of rendering ineligible the members of families which had reigned over France. It made the presidency an office dependent upon popular acclamation.

The election was keenly contested; the Socialists adopted as their candidate Ledru-Rollin, the Republicans Cavaignac; and the recently reorganized Imperialist party Prince Louis Napoleon. Louis Napoleon, unknown in 1835, and forgotten or despised since 1840, had in the last eight years advanced so much in the public estimation to be elected to the Constituent Assembly in 1848 by five departments. He owed this rapid increase of popularity partly to blunders of the government of July, which had unwisely aroused the memory of the country, filled as it was with recollections of the Empire, and partly to Louis Napoleon’s campaign carried on from his prison at Ham by means of pamphlets of socialist tendencies. Moreover, the monarchists, led by Thiers and the committee of the Rue de Poitiers, were no longer content even with the safe dictatorship of the upright Cavaignac, and joined forces with the Bonapartists. On the 10th of December the peasants gave over 5,000,000 votes to a name, Napoleon, which stood for order at all costs, against 1,400,000 for Cavaignac.

reviews, at which cries of "Vive Napoléon" showed that the army was with him; he superseded General Changarnier, on whose arms the parliament relied for the projected monopolarchic coup d'état; he replaced his Orleanist ministry by obscure men devoted to his own cause, such as Morny, Fleury and Persigny, and gathered round him officers of the African army, broken men like General Saint-Arnaud; in fact he practically declared open war.

His reply to the votes of censure passed by the Assembly, and their refusal to increase his civil list, was to hint at a vast communist plot in order to scame the bourgeoisie, and to denounce the electoral law of the 31st of May in order to gain the support of the mass of the people. The Assembly retaliated by throwing out the proposal for a partial reform of that article of the constitution which prohibited the re-election of the president and the re-establishment of universal suffrage (July). All hope of a peaceful issue was at an end. When the questors called upon the Chamber to have posted up in all barrack the decree of the 6th of May 1848 concerning the right of the Assembly to demand the support of the troops if attacked, the Mountain, dreading a restoration of the monarchist Directory and the Bonapartists against the measure, thus disarming the legislative power. Louis Napoléon saw his opportunity. On the night between the 1st and 2nd of December 1851, the anniversary of Austerlitz, he dissolved the Chamber, re-established universal suffrage, had all the party leaders arrested, and summoned a new assembly to prolong his term of office for ten years. The deputies who had met under Berryer at the Mairie of the tenth arrondissement to defend the constitution and proclaim the deposition of Louis Napoléon were scattered by the troops at Mazar and Mont Valérien. The resistance organized by the republicans within Paris under Victor Hugo was soon subdued by the intoxicated soldiers. The more serious resistance in the departments was crushed by declaring a state of siege and by the "mixed commissions." The plebiscite of the 20th of December ratified by a huge majority the coup d'état in favour of the prince-president, who alone reaped the benefit of the excesses of the Republicans and the reactionary passions of the monarchists.

The second attempt to revive the principle of 1789 only served as a preface to the restoration of the Empire. The new anti-parliamentary constitution of the 14th of January 1852 was to a large extent merely a repetition of that of the year VIII. All executive power was entrusted to the head of the state, who was solely responsible to the people, now powerless to exercise any of their rights. He was to nominate the members of the council of state, whose duty it was to prepare the laws, and of the senate, a body permanently established as a constituent part of the empire. One innovation was made, namely, that the Legislative Body was elected by universal suffrage, but it had no right of initiative, all laws being proposed by the executive power. This new and violent political change was rapidly followed by the same consequences as had attended that of Brumaire. On the 2nd of December 1852, France, still under the effect of the Napoleonic virus, and the fear of anarchy, conferred almost unanimously by a plebiscite, a supreme power, with the title of emperor, upon Napoleon III.

But though the machinery of government was almost the same under the Second Empire as it had been under the First, the principles upon which its founder based it were different. The function of the Empire, as he loved to repeat, was to guide the people internally towards justice and externally towards perpetual peace. Holding his power by universal suffrage, and having frequently, from his prison or in exile, reproached former oligarchical governments with neglecting social questions, he set out to solve them by organizing a system of government based on the principles of the "Napoléonic Idea," i.e. of the emperor, the elect of the people as the representative of the democracy, and as such supreme; and of himself, the representative of the great Napoléon, "who had sprung armed from the Revolution like Minerva from the head of Jove," as the guardian of the social gains of the revolutionary epoch. But he soon proved that social justice did not mean liberty; for he acted in such a way that those of the principles of 1848 which he had preserved became a mere sham. He proceeded to paralyze all those active national forces which tend to create the public spirit of a people, such as parliament, universal suffrage, the press, education and associations. The Legislative Body was not allowed either to elect its own president or to regulate its own procedure, or to propose a law or an amendment, or to vote on the budget in detail, or to make its deliberations public. It was a dumb parliament. Similarly, universal suffrage was supervised and controlled by means of official candidature, by forbidding free speech and action in electoral matters to the Opposition, and by a skilful adjustment of the electoral districts in such a way as to overwhelm the Liberal vote in the mass of the rural population. The press was subjected to a system of cautionnements, i.e. "caution money," deposited as a guarantee of good behaviour, and averissemens, i.e. requests by the authorities to cease publication of certain articles, under pain of suspension or suppression; while books were subject to a censorship. France was like a sick-wench where nobody might speak aloud. In order to counteract the opposition of individuals, a system of surveillance was instituted. Orsini's attack on the emperor in 1858, though purely Italian in its motive, served as a pretext for increasing the severity of this régime by the law of general security (sûreté générale) which authorized the internment, exile or deportation of any suspect without trial. In the same way public instruction was strictly supervised, the teaching of philosophy was suppressed in the Lycées, and the disciplinaire powers of the administration were increased. In fact for seven years France had no political life. The Empire was carried on by a series of plebiscites. Up to 1857 the Opposition did not exist; from then till 1860 it was reduced to five members: Darimon, Émile Ollivier, Hénon, J. Favre and E. Picard. The royalists waited inactive after the new and unsuccessful attempt made at Frohsdorf in 1853, by a combination of the legitimists and Orleanists, to re-create a living monarchy out of the ruin of two royal families. Thus the events of that ominous night in December were closing the future to the younger generations as well as to those who had grown up during forty years of liberty.

But it was not enough to abolish liberty by conjuring up the spectre of demagogy. It had to be forgotten, the great silence had to be covered by the noise of festivities and material enjoyment, the imagination of the French people had to be distracted from public affairs by the taste for work, the love of gain, the passion for good living. The success of the imperial despotism, as of any other, was bound up with that material prosperity which would make all interests heed the thought of revolution. Napoléon III., therefore, looked for support to the clergy, the great financiers, industrial magnates and landed proprietors. He revived on his own account the "Let us grow rich" of 1830. Under the influence of the Saint-Simonians and men of business great credit establishments were instituted and vast public works entered upon: the Crédit foncier de France, the Crédit mobilier, the conversion of the railways into six great companies between 1852 and 1857. The rage for speculation was increased by the inflow of Californian and Australian gold, and consumption was facilitated by a general fall in prices between 1856 and 1860, due to an economic revolution which was soon to overthrow the tariff wall, as it had done already in England. Thus French activity flourished exceedingly between 1852 and 1857, and was merely temporarily checked by the crisis of 1857. The universal Exhibition of 1855 was its culminating point. Art felt the effects of this increase of comfort and luxury. The great enthuasms of the romantic period were over; philosophy became sceptical and literature merely amusing. The festivities of the court at Compiègne set the fashion for the bourgeoisie, satisfied with this energetic government which kept such good guard over their bank balances.

If the Empire was strong, the emperor was weak. At once headstrong and a dreamer, he was full of rash plans, but irresolute
in carrying them out. An absolute despot, he remained what his life had made him, a conspirator through the very mysticism of his mental habit, and a revolutionary by reason of his demagogic imperialism and his democratic chauvinism. In his opinion the artificial work of the congress of Vienna, involving the downfall of his own family and of France, ought to be destroyed, and Europe organized as a collection of great industrial states, united by community of interests and bound together by commercial treaties, and expressing this unity by periodic congresses presided over by himself, and by universal exhibitions. In this way he would reconcile the revolutionary principle of the supremacy of the people with historical tradition, a thing which neither the Restoration nor the July monarchy nor the Republic of 1838 had been able to achieve. Universal suffrage, the organization of Rumanian, Italian and German nationality, and commercial liberty; this was to be the work of the Revolution. But the creation of great states side by side with France brought with it the necessity for looking for territorial compensation elsewhere, and consequently for violating the principle of nationality and abjuring his system of economic peace. Napoleon III.'s foreign policy was as contradictory as his policy in home affairs, "L'Empire, c'est la paix," was his cry; and he proceeded to make war.

So long as his power was not yet established, Napoleon III. made especial efforts to reassure European opinion, which had been made uneasy by his previous protestations against the treaties of 1815. The Crimean War, in which, supported by England and the king of Sardinia, he upheld against Russia the policy of the integrity of the Turkish empire, a policy traditional in France since Francis I., won him the adherence both of the old parties and of the Liberals. And this war was the prototype of all the rest. It was entered upon with no clearly defined military purpose, and continued in a hesitating way. This was the cause, after the victory of the allies at the Alma (September 14, 1854), of the long and costly siege of Sébastopol (September 8, 1855). Napoleon III., whose joy was at its height owing to the signature of a peace which excluded Russia from the Black Sea, and the birth of the prince imperial, which ensured the continuation of his dynasty, thought that the time had arrived to make a beginning in applying his system. Count Walewski, his minister for foreign affairs, gave a sudden and unexpected extension of scope to the deliberations of the congress which met at Paris in 1856 by inviting the plenipotentiaries to consider the questions of Greece, Rome, Naples, &c. This motion contained the principle of all the upheavals which were to effect such changes in Europe between 1859 and 1871. It was Cavour and Piedmont who immediately benefited by it, for thanks to Napoleon III. they were able to lay the Italian question before an assembly of diplomatic Europe.

It was not Orsini's attack on the 14th of January 1858 which brought this question before Napoleon. It had never ceased to occupy him since he had taken part in the patriotic conspiracies in Italy in his youth. The triumph of his armies in the East now gave him the power necessary to accomplish this mission upon which he had set his heart. The suppression of public opinion made it impossible for him to be enlightened as to the conflict between the interests of the country and his own generous visions. The sympathy of all Europe was with Italy, torn for centuries past between so many masters; under Alexander II. Russia, won over since the interview of Stuttgart by the emperor's generosity rather than conquered by armed force, offered no opposition to this act of justice; while England applauded it from the first. The emperor, divided between the empire Eugénie, who as a Spaniard and a devout Catholic was hostile to anything which might threaten the papacy, and Prince Napoleon, who as brother-in-law of Victor Emmanuel favoured the cause of Piedmont, hoped to conciliate both sides by setting up an Italian federation, intending to reserve the presidency of it to Pope Pius IX., as a mark of respect to the moral authority of the Church. Moreover, the very difficulty of the undertaking appealed to the emperor, elated by his recent success in the Crimea. At the secret meeting between Napoleon and Count Cavour (July 20, 1858) this eventual armed intervention of France, demanded by Orsini before he mounted the scaffold, was definitely promised.

The ill-advised Austrian ultimatum demanding the immediate cessation of Piedmont's preparations for war precipitated the Italian expedition. On the 3rd of May 1859 Napoleon declared his intention of making Italy "free from the Alps to the Adriatic." As he had done four years ago, he plunged into the war with no settled scheme and without preparation; he held out great hopes, but without reckoning what efforts would be necessary to realize them. Two months later, in spite of the victories of Montebello, Magenta and Solferino, he suddenly broke off, and signed the patched-up peace of Villafranca with Francis Joseph (July 9). Austria ceded Lombardy to Napoleon III., who in turn ceded it to Victor Emmanuel; Modena and Tuscany were restored to their respective dukes, the Romagna to the pope, now president of an Italian federation. The mountain had brought forth a mouse.

The reasons for this break-off on the part of the emperor in the midst of his apparent triumph were many. Neither Magenta nor Solferino had been decisive battles. Further, his idea of a federation was menaced by the revolutionary movement which seemed likely to drive out all the princes of central Italy, and to involve him in an unwelcome dispute with the French clerical party. Moreover, he had forgotten to reckon with the Germanic Confederation, which was bound to come to the assistance of Austria. The mobilization of Prussia on the Rhine, combined with military difficulties and the risk of a defeat in Venetian territory, rather damped his enthusiasm, and decided him to put an end to the war. The armistice fell upon the Italians as a bolt from the blue, convincing them that they had been betrayed; on all sides despair drove them to sacrifice their jealously guarded independence to national unity. On the one hand the Catholics were agitating throughout all Europe to obtain the independence of the papal territory; and the French republicans were protesting on the other hand, against the abandonment of the revolutionary traditions, the revival of which they had hailed so enthusiastically. The emperor, unprepared for the turn which events had taken, attempted to disentangle this confusion by suggesting a fresh congress of the Powers, which should reconcile dynastic interests with those of the people. After a while he gave up the attempt and resigned himself to the position, his actions having had more wide-reaching results than he had wished. The treaty of Zürich proclaimed the fallacious principle of non-intervention (November 10, 1859); and then, by the treaty of Turin of the 24th of May 1860, Napoleon threw over his ill-timed confederation. He conciliated the mistrust of Great Britain by replacing Walewski, who was hostile to his policy, by Thouvenel, an anti-clerical and a supporter of the English alliance, and he counterbalanced the increase of the new Italian kingdom by the acquisition of Nice and Savoy. Napoleon, like all French governments, only succeeded in finding a provisional solution for the Italian problem.

But this solution would only hold good so long as the emperor was in a powerful position. Now this Italian war, in which he had given his support to revolution beyond the Alps, and, though unintentionally, compromised the temporal power of the popes, had given great offence to the Catholics, to whose support the establishment of the Empire was largely due. A keen Catholic opposition sprang up, voiced in L. Veilliot's paper the Univera, and was not silenced even by the Syrian expedition (1860) in favour of the Catholic Maronites, who were being persecuted by the Druses. On the other hand, the commercial treaty with Great Britain which was signed in January 1860, and which ratified the free-trade policy of Richard Cobden and Michael Chevalier, had brought upon French industry the sudden shock of foreign competition. Thus both Catholics and protectionists made the discovery that absolutism may be an excellent thing when it
serves their ambitions or interests, but a bad thing when it is exercised at their expense. But Napoleon, in order to restore the prestige of the Empire before the newly-awakened hostility of public opinion, tried to gain from the Left the support which he had lost from the Right. After the return from Italy the general amnesty of the 16th of August 1859 had marked the evolution of the absolutist empire towards the liberal, and later parliamentary empire, which was to last for ten years.

Napoleon began by removing the gag which was keeping the country in silence. On the 24th of November 1860, a coup d'état matured during his solitary meditations, like a conspirator in his love of hiding his mysterious thoughts even from his ministers, he granted to the Chambers the right to vote an address annually in answer to the speech from the throne, and to the press the right of reporting parliamentary debates. He counted on the latter concession to hold in check the growing Catholic opposition, which was becoming more and more alarming by the policy of laïcisation practised by the emperor in Italy. But the government majority already showed some signs of independence. The right of voting on the budget by sections, granted by the emperor in 1860, was a new weapon given to his adversaries. Everything conspired in their favour: the anxiety of those candid friends who were calling attention to the defective budget; the commercial crisis, aggravated by the American Civil War; and above all, the restless spirit of the emperor, who had annoyed his opponents in 1860 by insisting on an alliance with Great Britain in order forcibly to open the Chinese ports for trade, in 1863 by his ill-fated attempt to put down a republic and set up a Latin empire in Mexico in favour of the archduke Maximilian of Austria, and from 1861 to 1863 by embarking on colonizing experiments in Cochin China and Annam.

The Liberal Empire. The policy of nationalism. The régime of concessions.

The same inconsistencies occurred in the emperor's European politics. The support which he had given to the Italian cause had aroused the eager hopes of other nations. The proclamation of the kingdom of Italy on the 18th of February 1861 after the rapid annexation of Tuscany and the kingdom of Naples had proved the danger of half-measures. But when a concession, however narrow, had been made to the liberty of one nation, it could hardly be refused to the no less legitimate claims of the rest. In 1863 these “new rights” again clamoured loudly for recognition, in Poland, in Schleswig and Holstein, in Italy, now indeed united, but with neither frontiers nor capital, and in the Danubian principalities. In order to extricate himself from the Polish impasse, the emperor again had recourse to his expedition—always fruitless because always inopportune—of a congress. He was again unsuccessful: England refused even to admit the principle of a congress, while Austria, Prussia and Russia gave their adherence only on conditions which rendered it futile, i.e. they reserved the vital questions of Venetia and Poland.

Thus Napoleon had yet again to disappoint the hopes of Italy, let Poland be crushed, and Germany triumph over Denmark in the Schleswig-Holstein question. These inconsistencies resulted in a combination of the opposition parties, Catholic, Liberal and Republican, in the Union libérale. The elections of May-June 1863 gained the Opposition forty seats and a leader, Thiers, who at once urgently gave voice to its demand for “the necessary liberties.”

It would have been difficult for the emperor to mistake the importance of this manifestation of French opinion, and in view of his international failures, impossible to repress it. The sacrifice of Persigny, minister of the interior, who was responsible for the elections, the substitution for the ministers without portfolio of a sort of presidency of the council filled by Rouher, the “Vice-Emperor,” and the nomination of V. Duruy, an anti-clerical, as minister of public instruction, in reply to those attacks of the Church which were to culminate in the Syllabus of 1864, all indicated a distinct rapprochement between the emperor and the Left. But though the opposition represented by Thiers was rather constitutional than dynastic, there was another and irreconcilable opposition, that of the amnestied or voluntarily exiled republicans, of whom Victor Hugo was the eloquent mouthpiece. Thus those who had formerly constituted the governing classes were again showing signs of their ambition to govern. There appeared to be some risk that this movement among the bourgeoisie might spread to the people. As Anetus recruited his strength by touching the earth Napoleon believed that he would consolidate his menaced power by again turning to the labouring masses, by whom that power had been established.

This industrial policy he embarked upon as much from motives of interest as from sympathy, out of opposition to the bourgeoisie, which was ambitious of governing or desiring of his overthrow. His course was all the easier, since he had only to exploit the prejudices of the working classes. They had never forgotten the loi Chapelle of 1791, which by forbidding all combinations among the workmen had placed them at the mercy of their employers, nor had they forgotten how the limited suffrage had conferred upon capital a political monopoly which had put it out of reach of the law, nor how each time they had let their position of rigid isolation in order to save the Charter or universal suffrage, the triumphant bourgeoisie had repaid the liberals at the ballot with neglect. The silence of public opinion under the Empire and the superficial state of business had completed the separation of the labouring masses from the political parties. The visit of an elected and paid labour delegation to the Universal Exhibition of 1862 in London gave the emperor an opportunity for re-establishing relations with that party, and these relations were to his mind all the more profitable, since the labour party, by refusing to associate their social and industrial claims with the political ambitions of the bourgeoisie, maintained a neutral attitude between the parties, and could, if necessary, divide them, while by its keen criticism of society it aroused the conservative instincts of the bourgeoisie and consequently checked their enthusiasm for liberty. A law of the 23rd of May 1863 gave the workmen the right, as in England, to save money by creating co-operative societies. Another law, of the 25th of May 1864, gave them the right to enforce better conditions of labour by organizing strikes. Still further, the emperor permitted the workmen to imitate their employers by establishing unions for the permanent protection of their interests. The “sociétés de travailleurs,” with the characteristic French tendency to insist on the universal application of a theory, wished to substitute for the narrow utilitarianism of the English trade unions the ideas common to the wage-earning classes of the whole world, he put no obstacles in the way of their leader M. Tolain's plan for founding an International Association of Workers (Société Internationale des Travailleurs). At the same time he encouraged the provision made by employers for thrift and relief and for improving the condition of the working classes.

Thus assured of support, the emperor, through the mouthpiece of M. Rouher, who was a supporter of the absolutist régime, was able to refuse all fresh claims on the part of the Liberals. He was aided by the cessation of the industrial crisis as the American civil war came to an end, by the apparent closing of the Roman question by the convention of the 15th of September, which guaranteed to the papal states the protection of Italy, and finally by the treaty of the 30th November 1864, which temporarily put an end to the crisis of the Schleswig-Holstein question. But after 1865 the momentary agreement which had bound Austria and Prussia for the purpose of administering the conquered duchy gave a place to a silent antipathy which foreboded a rupture. Yet the Austro-Prussian War of 1866 was not unexpected, its rapid termination and fateful outcome came as a severe and sudden shock to France. Napoleon had hoped to gain fresh prestige for his throne and new influence for France by an intervention at the proper moment between combatants equally matched and mutually exhausted. His calculations were upset and his hopes dashed by the battle of Sadowa (Königrätz) on the 4th of July. The treaty of Prague put an end to the secular rivalry of Habsburg and Hohenzollern for the hegemony of Germany, which had been France's
government the project abandoned by Napoleon since 1866 of a settlement on the basis of the status quo with reciprocal disarmament. Napoleon refused, on hearing from Colonel Stoffel, his military attaché at Berlin, that Prussia would not agree to disarmament. But he was more anxious than he was willing to show. A reconstitution of the military organization seemed to him to be necessary. This Marshal Niel was unable to obtain either from the Bonapartist Opposition, who feared the electors, in whom the old patriotism had given place to the commercial or cosmopolitan spirit, or from the Republican opposition, who were unwilling to strengthen the despotism. Both of them were blinded by party interest to the danger from outside.

The emperor's good fortune had departed; he was abandoned by men and disappointed by events. He had vainly hoped that, though by the laws of May-June 1868, granting the freedom of the press and authorizing meetings, he had conceded the right of speech, he would retain the right of action; but he had played into the hands of his enemies. Victor Hugo's Châtiments, the insults of Rochefort's Lanterne, the subscription for the monument to Baudin, the deputy killed at the barricades in 1851, followed by Gambetta's terrible speech against the Empire on the occasion of the trial of Deelves, soon showed that the republican party was irrevocable, and that upon the Republic and monarchy if the two parties were becoming more and more discontended, while the industries formerly protected were equally dissatisfied with the free-trade reform. Worse still, the working classes had abandoned their political neutrality, which had brought them nothing but unpopularity, and gone over to the enemy. Despising Proudhon's impassioned attacks on the slavery of communism, they had gradually been won over by the collectivist theories of Karl Marx or the revolutionary theories of Bakounine, as set forth at the congresses of the International. At these Labour congresses, the fame of which was only increased by the fact that they were forbidden, it had been affirmed that the social emancipation of the worker was inseparable from his political emancipation. Henceforth the union between the internationalists and the republican bourgeois was an accomplished fact. The Empire, taken by surprise, sought to curb both the middle classes and the working classes and forced them both into revolutionary action. On every side took place strikes, forming as it were a review of the effective forces of the Revolution.

The elections of May 1869, made during these disturbances, indicated a verdict upon the Empire a serious moral defeat. In spite of the revival by the government of the cry of the regime of terror, Ollivier, the advocate of conciliation, was rejected by Paris, while 40 irreconcilables and 116 members of the Third Party were elected. Concessions had to be made to these, so by the senatus-consulte of the 8th of September 1869 a parliamentary monarchy was substituted for personal government. On the 2nd of January 1870 Ollivier was placed at the head of the first homogeneous, united and responsible ministry. But the republican party, unlike the country, which hailed this reconciliation of liberty and order, refused to be content with the liberties they had won; they refused all compromise, declaring themselves more than ever decided upon the overthrow of the Empire. The murder of the journalist Victor Noir by Pierre Bonaparte, a member of the imperial family, gave the revolutionaries their long desired opportunity (January 10). But the émeute ended in a failure, and the emperor was able to answer the personal threats against him by the overwhelming victory of the pleiscite of the 8th of May 1870.

But this success, which should have consolidated the Empire, determined its downfall. It was thought that a diplomatic success should complete it, and make the country forget liberty for glory. It was in vain that after the parliamentary revolution of the 2nd of January that prudent statesman Comte Daru revived, through Lord Clarendon, Count Beust's plan of disarmament after Sadowa. He met with a refusal from Prussia and from the imperial courage. The Empress Eugénie was credited with
the remark, “If there is no war, my son will never be emperor.”

The desired pretext was offered on the 3rd of July 1870 by the candidature of a Hohenzollern prince for the throne of Spain. To the French people it seemed that Prussia, barely mistress of Germany, was reviving against France the traditional policy of the Habsburgs.

France, having rejected for dynastic reasons the candidature of a Frenchman, the duc de Montpensier, saw herself threatened with a German prince. Never had the emperor, nor both physically and morally ill, greater need of the counsels of a clear-headed statesman and the support of an enlightened public opinion if he was to defeat the statecraft of Bismarck. But he could find neither.

Ollivier’s Liberal ministry, wishing to show itself as jealous for national interests as any absolutist ministry, bent upon doing something great, and swept away by the force of that opinion which it had itself set free, at once accepted the war as inevitable, and prepared for it as if it were a fight. In fact, the refusal of the duc de Gramont, the minister for foreign affairs, before the Legislative Body of the 5th of July, Europe, in alarm, supported the efforts of French diplomacy and obtained the withdrawal of the Hohenzollern candidature. This did not suit the views either of the war party in Paris or of Bismarck, who wanted the other side to declare war. The ill-advised action of Gramont in demanding from King William one of those promises for the future which are humiliating but never binding, gave Bismarck his opportunity, and the king’s refusal was transformed by him into an insult by the “editing” of the Ems telegram. The chamber, in spite of the desperate efforts of Thiers and Gambetta, now voted by 246 votes to 10 in favour of the war.

France found herself isolated, as much through the duplicity of Napoleon as through that of Bismarck. The disclosure to the diets of Munich and Stuttgart of the treaty of the terms laid by Napoleon on the territories of Hesse and Bavaria had since the 22nd of August 1866 estranged southern Germany from France, and disposed the southern states to sign the military convention with Prussia. Owing to a similar series of blunders, the rest of Europe had become hostile. Russia, which it had been Bismarck’s study both during and after the Polish insurrection of 1863 to draw closer to Prussia, learnt with annoyance, by the same indiscretion, how Napoleon was keeping his promises made at Stuttgart. The hope of gaining a revenge in the East for her defeat of 1856 while France was in difficulties made her decide on a benevolent neutrality. The disclosure of Benedetti’s designs of 1867 on Belgium and Luxemburg equally assured an unfriendly neutrality on the part of Great Britain. The emperor counted at least on the alliance of Austria and Italy, for which he had been negotiating since the Salzburg interview (August 1867). But Austria, having suffered at his hands in 1859 and 1866, was not ready and asked for a delay before joining in the war; while the hesitating friendships of Italy could only be won by the evacuation of Rome. The chasmpots of Montana, Rouher’s “Never,” and the hostility of the Catholic empress to any secret article which should open to Italy the gates of the capital, deprived France of her last friend.

Marshall Leboeuf’s armies were no more effective than Gramont’s alliances. The incapacity of the higher officers of the French army, the lack of preparation for war at headquarters, the selfishness and shirking of responsibility on the part of the field officers, the absence of any fixed plan when failure to mobilize had destroyed all chance of the strong offensive which had been counted on, and the folly of depending on chance, as the emperor had so often done successfully, instead of scientific warfare, were all plainly to be seen as early as the insignificant engagement of Sarbrücken.

Thus the French army proceeded by disastrous stages from Weissenburg, Forbach, Froeschweiler, Boray, Gravelotte, Nossienville and Saint-Privat to the siege of Metz and the slaughter at Luty. By the capitulation of Sedan the Empire lost its only support, the army, and fell. Paris was left unprotected and emptied of troops, with only a woman at the Tuileries, a terrified Assembly at the Palais-Bourbon, a ministry, that of Palkiao, without authority, and leaders of the Opposition who fled as the catastrophe approached. (P.W.)

### The Third Republic 1870-1909

The Third Republic may be said to date from the revolution of the 4th of September 1870, when the republican deputies of Paris at the hôtel de ville constituted a provisional government under the presidency of General Trochu, military governor of the capital. The Empire had fallen, and the emperor was a prisoner in Germany. As, however, since the great revolution émigrés in France have been only passing expatriates, not inextricably associated with the destinies of the people, but bound to disappear when accounted responsible for national disaster, the surrender of Louis Napoleon’s sword to William of Prussia did not disarm the country. Hostilities were therefore continued. The provisional government had to assume the part of a Committee of National Defence, and while insurrection was threatening in Paris, it had, in the face of the invading Germans, to send a delegation to Tours to maintain the relations of France with the outside world. Paris was invested, and for five months endured siege, bombardment and famine. Before the end of October the capitulation of Metz, by the treason of Marshal Bazaine, deprived France of the last relic of its regular army. With indomitable courage the garrison of Paris made useless sorties, while an army of irregular troops vainly essayed to resist the invaders who had reached the valley of the Loire. At last forcing Government of National Defence, thus driven from Tours, took refuge at Bordeaux, where it awaited the capitulation of Paris, which took place on the 29th of January 1871. The same day the preliminaries of peace were signed at Versailles, which, confirmed by the treaty of Frankfort of the roth of May, transferred from France to Germany the whole of Alsace, excepting Belfort, and a large portion of Lorraine, including Metz, with a money indemnity of two hundred millions sterling.

On the 13th of February 1871 the National Assembly, elected after the capitulation of Paris, met at Bordeaux and assumed the powers hitherto exercised by the Government of National Defence. Since the meeting of the states-general in 1789 no representative body in France had ever contained so many men of distinction. Elected to conclude a peace, the great majority of its members were monarchists, Gambetta, the rising hope of the republicans, having discredited his party in the eyes of the weary population by his efforts to carry on the war. The Assembly might thus have there and then restored the monarchy had not the monarchists been divided among themselves as royalist supporters of the comte de Chambord, grandson of Charles X., and as Orleanists favouring the claims of the comte de Paris, grandson of Louis Philippe. The majority being unable to unite on the essential point of the choice of a sovereign, decided to allow the Republic, declared on the morrow of Sedan, to liquidate the disastrous situation. Consequently, on the 17th of February the National Assembly elected Thiers as “Chief of the Executive Power of the French Republic,” the abolition of the Empire being formally voted a fortnight later. The old minister of Louis Philippe, who had led the opposition to the Empire, and had been the chief opponent of the war, was further marked out for the position conferred upon him by his defeat of the twenty-six departments in recognition of his tour through Europe after the first defeats, undertaken in the patriotic hope of obtaining the intervention of the Powers on behalf of France. Thiers composed a ministry, and announced that the first duty of the government,
before examining constitutional questions, would be to reorganize the forces of the nation in order to provide for the enormous war indemnity which had to be paid to Germany before the territory could be liberated from the presence of the invader. The tacit acceptance of this arrangement by all parties was known as the "pacte de Bordeaux." Apart from the pressure of patriotic considerations, it pleased the republican minority to have the government of France officially proclaimed a Republic, while the monarchists thought that pending their choice of a monarch it might popularize their cause not to have it associated with the imposition of the burden of war taxation. From this fortuitous and informal transaction, accepted by a monarchical Assembly, sprang the Third Republic, the most durable régime established in France since the ancient monarchy disappeared in 1792.

The Germans marched down the Champs Elysées on the 1st of March 1871, and occupied Paris for forty-eight hours. The National Assembly then decided to remove its sittings to Versailles; but two days before its arrival at the palace, where the king of Prussia had just been proclaimed German emperor, an insurrection broke out in Paris. The revolutionary element, which had been foremost in proclaiming the Republic on the 2d of December, had shown the signs of dissension, which were the siege. On the conclusion of the peace, the triumphal entry of the German troops, the threatened disbanding of the national guard by an Assembly known to be anti-republican, and the resumption of orderly civic existence after the agitated life of a suffering population isolated by siege, had excited the nerves of the Parisians, always prone to revolution. The Commune was proclaimed on the 18th of March, and Paris was declared to be a free town, which recognized no government but that chosen by the people within its walls, the communard theory being that the state should consist of a federation of self-governing communes subject to no central power. Administrative autonomy was not, however, the real aim of the insurgent leaders. The name of the Commune had always been a rallying sign for violent revolutionaries ever since the Terrorists had found their last support in the municipality of Paris in 1794. In 1871 among the communard chiefs were revolutionaries of every sect, who, disagreeing on governmental and economic principles, were united in their vague but perpetual hostility to the existing order of things. The regular troops of the garrison of Paris followed the Assembly to Versailles, troops who were rebels against the Commune. On the 21st of May, the town, the army of Sedan and Metz, liberated from captivity in Germany. With this force the government of the Republic commenced the siege of Paris, in order to capture the city from the Commune, which had established the parody of a government there, having taken possession of the administrative departments and set a minister at the head of each office. The second siege lasted six weeks under the eyes of the victorious Germans encamped on the heights overlooking the capital. The presence of the enemy, far from restraining the humiliating spectacle of Frenchmen waging war on Frenchmen in the hour of national disaster, seemed to encourage the fury of the combatants. The communards, who had begun their reign by the murder of two generals, concluded it, when the Versailles troops were taking the city, with the massacre of a number of eminent citizens, including the archbishop of Paris, and with the destruction by fire of many of the finest historical buildings, including the palace of the Tuileries and the hôtel de ville. History has rarely known a more unpatriotic crime than that of the insurrection of the Commune; but the punishment inflicted on the insurgents by the Versailles troops was so relentless that it seemed to be a counter-manifestation of French hatred for Frenchmen in civil disturbance rather than a judicial penalty applied to a heinous offence. The number of Parisians killed by French soldiers in the last week of May 1871 was probably 20,000, though the partisans of the Commune declared that 36,000 men and women were shot in the streets or after summary court-martial.

It is from this point that the history of the Third Republic commences. In spite of the doubly tragic ending of the war the vitality of the country seemed impaired. With ease and without murmur it supported the new burden of taxation called for by the war indemnity and by the reorganization of the shattered forces of France. Thiers was thus aided in his task of liberating the territory from the presence of the enemy. His proposal at Bordeaux to make the "essai loyal" of the Republic, as the form of government which caused the least division among Frenchmen, was discouraged by the excesses of the Commune which associated republicanism with revolutionary disorder. Nevertheless, the monarchists of the National Assembly received a note of warning that the country might dispense with their services unless they displayed governmental capacity, when in July 1871 the republican minority was largely increased at the bye-elections.

The next month, within a year of Sedan, a provisional constitution was voted, the title of president of the French Republic being then conferred on Thiers. The monarchists consented to this against their will; but they had their own way when they conferred constitutional powers on the Assembly in opposition to the republicans, who argued that it was a usurpation of the sovereignty of the people for a body elected for another purpose to assume the power of giving a constitution to the land without a special mandate from the nation. The debate gave Gambetta his first triumph, which he repeated in the subsequent "coups furieux" of Tours, whom Thiers had denounced for his efforts to prolong the hopeless war, was about to become the chief support of the aged Orleanist statesman whose supreme achievement was to be the foundation of the Republic.

It was in 1872 that Thiers practically ranged himself with Gambetta and the republicans. The divisions in the monarchical party made an immediate restoration impossible. This situation induced some of the moderate deputies, whose tendencies were Orleanist, to support the organization of a Republic which now no longer found its chief support in the revolutionary section of the nation, and it suited the ideas of Thiers, whose personal ambition was not less than his undisputed patriotism. Having become unexpectedly chief of the state at seventy-four he had no wish to descend again to the position of a minister of the Orleans dynasty which he had held at thirty-five. So, while the royalists refused to admit the claims of the comte de Paris, the old friend of Louis Philippe did his best to undermine the popularity of the Orleans tradition, which had been great among the Liberals during the Second Empire. He moved the Assembly to declare to the Orleanist princes the value of their property confiscated under Louis Napoleon. This he did in the well-founded belief that the family would discredit itself in the eyes of the nation by accepting two millions sterling of public money at a moment when the country was burdened with the war indemnity. The incident was characteristic of his wary policy, as in the face of the anti-republican majority in the Assembly he could not openly break with the Right; and when it was suggested that he was too favourable to the maintenance of the Republic he offered his resignation, the refusal of which he took as indicating the indispensable nature of his services. Meanwhile Gambetta, by his popular eloquence, had won for himself in the autumn a triumphal progress, in the course of which he declared at Grenoble that political power had passed into the hands of "une couche sociale nouvelle," and he appealed to the new social strata to put an end to the comedy of a Republic without republicans. When the Assembly resumed its sittings, order having been restored in the land disturbed by war and revolution, the system of government was reorganized and the reorganization of the army planned. Thiers read to the house a confidential message which marked such a distinct movement towards the Left that Gambetta led the applause. "The Republic exists," said the president, "it is the lawful government of the country, and to devise anything else is to devise the most terrible of revolutions."

The year 1873 was full of events fateful for the history of France. It opened with the death of Napoleon III. at Chislehurst; but the disasters amid which the Second Empire had ended were too
recent for the youthful promise of his heir to be regarded as having any connexion with the future fortunes of France, except by the small group of Bonapartists. Thiers remained the centre of interest. Much as the monarchists disliked him, they at first shrank from upsetting him before they were ready with a scheme of monarchical restoration, and while Gambetta's authority was growing in the land. But when the Left Centre took alarm at the return of radical deputies at numerous by-elections the reactionaries utilized the divisions in the republican party, and for the only time in the history of the Third Republic they gave proof of parliamentary adroitness. The date for the evacuation of France by the German troops had been advanced, largely owing to Thiers' successful efforts to raise the war indemnity. The monarchical majority, therefore, thought the moment had arrived when his services might safely be dispensed with, and the campaign against him was ably conducted by a coalition of Legitimists, Orleanists and Bonapartists. The attack on Thiers was led by the duc de Broglie, the son of another minister of Louis Philippe and grandson of Madame de Staël. Operations began with the removal from the chair of the Assembly of Jules Grévy, an action which the republicans regarded as the foundation of Bordeaux, and the substitution of Buffet, an old minister of the Second Republic who had rallied to the Empire. A debate on the political ten- dency of the government brought Thiers himself to the tribune to defend his policy. He maintained that a conservative Republic was the only régime possible, seeing that the monarchists in the Assembly could not make a choice between their three pretenders to the throne. A resolution, however, was carried which provoked the old statesman into tendering his resignation. This time it was not declined, and the majority with unseemly haste elected as president of the Republic Marshal MacMahon, duc de Magenta, an honest soldier of royalist sympathies, who had won renown and a ducal title on the battlefields of the Second Empire. In the eyes of Europe the curt dismissal of the aged liberator of the territory was an act of ingratitude. Its justification would have been the success of the majority in forming a stable monarchical government; but the sole result of the 24th of May 1873 was to provide a definite date to mark the opening of the era of anti-republican incompetency in France which has lasted for more than a generation, and has been perhaps the most effective check to the revival of the Third Republic.

The political incompetency of the reactionaries was fated never to be corrected by the intelligence of its princes or of its chiefs, and the year which saw Thiers dismissed to make way for a restoration saw also that restoration indefinitely postponed by the fatal action of the legitimist pretender. The comte de Paris went to Frohsdorf to abandon to the comte de Chambord his claims to the crown as the heir of the July Monarchy, and to accept the position of dauphin, thus implying that his grandfather Louis Philippe was a usurper. With the “Government of Moral Order” in command the restoration of the monarchy seemed imminent, when the royalists had their hopes dashed by the announcement that “Henri V.” would accept the throne only on the condition that the nation adopted as the standard of France the white flag—at the very sight of which Marshal MacMahon said the rifles in the army would go off by themselves. The comte de Chambord's refusal to accept the tricolour was probably only the pretext of a childless man who had no wish to disturb his seclued life for the ultimate benefit of the Orleans family which had usurped his crown, had sent him as a child into exile, and outraged his mother the duchesse de Berry. Whatever his motive, his decision could have no other effect than that of establishing the Republic, as he was likely to live for years, during which the comte de Paris' claims had to remain suspended. It was not possible to leave the land for ever under the government improvised at Bordeaux when the Germans were masters of France; so the majority in the Assembly decided to organize another provisional government on more regular lines, which might possibly last till the comte de Chambord had taken the white flag to the grave, leaving the way to the throne clear for the comte de Paris. On the 10th of November 1873 a Bill was passed which instituted the Septennate, whereby the executive power was confided to Marshal MacMahon for seven years. It also provided for the nomination of a com- mission of the National Assembly to take in band the enactment of a constitutional law. Before this an important constitutional innovation had been adopted. Under Thiers there were no changes of ministry. The president of the Republic was perpetual prime minister, constantly dismissing individual holders of portfolios, but never changing at one moment the whole council of ministers. Marshal MacMahon, the day after his appointment, nominated a cabinet with a vice-president of the council as premier, and thus inaugurated the system of ministerial instability which has been the most conspicuous feature of the government of the Third Republic. Under the Septennate the ministers, monarchist or moderate republican, were socially and perhaps intellectually of a higher class than those who governed France during the last twenty years of the 19th century. But the duration of the cabinets was just as brief, displaying the fact, already similarly demonstrated under the Restoration and the July Monarchy, that in France parliamen- tary government is an importation not suited to the national temperament.

The duc de Broglie was the prime minister in MacMahon's first two cabinets which carried on the government of the country up to the first anniversary of Thiers' resignation. The duc de Broglie's defeat by a coalition of Legitimists and Bonapartists with the Republicans displayed the mutual attitude of parties. The Royalists, chagrined that the fusion of the two branches of the Bourbons had not brought the comte de Chambord to the throne, vented their rage on the Orleanists, who had the chief share in the government without being able to utilize it for their dynasty. The Bonapartists, now that the memory of the war was receding, were winning elections in the provinces, and were more encouraged by the youthful promise of the Prince Imperial. The republicans had so improved their position that the duc d'Audiffret-Pasquier, great-nephew of the chancellor Pasquier, tried to form a coalition ministry with M. Waddington, afterwards ambassador of the Republic in London, and other members of the Left Centre. Out of this uncertain state of affairs was evolved the constitution which has lasted longer than that of all those that France has tried since the abolition of the old monarchy in 1792. Its birth was due to chance. Not being able to restore a monarchy, the National Assembly was unwillingly driven to establish a republic, and as no limit was set by the law on the duration of its powers, it might have continued the provisional state of things had it not been for the Bona- partists. That party displayed so much activity in flattering for a plebiscite, that when the rural voters at by-elections began to rally to the Napoleonic idea, alarm seized the constitutionalists of the Right Centre who had never been persuaded by Thiers' exhortations to accept the Republic. Consequently in January 1875 the Assembly, having voted the general principle that the legislative power should be exercised by a Senate and a Chamber of Deputies, without any mention of the executive régime, accepted by a majority of one a generous resolution proposed by M. Wallon, a member of the Right Centre. It provided that the president of the Republic should be elected by the absolute majority of the Senate and the Chamber united as a National Assembly, that he should be elected for seven years, and be eligible for re-election. Thus by one vote the Republic was formally established, “the Father of the Constitution” being M. Wallon, who began his political experiences in the Legislative Assembly of 1849, and survived to take an active part in the Senate until the twentieth century.

The Republic being thus established, General de Cissey, who had become prime minister, made way for M. Buffet, but retained his portfolio of war in the new coalition cabinet, which contained some distinguished members of the two central groups, including M. Léon Say. A fortnight previously, at the end of February
Ordained by the constitution was the legal minimum age of their members, that of senators being forty-five, and of deputies twenty-five. It was enacted, moreover, that the Senate, by presidential decree, could be constituted into a high court for the trial of certain offences against the security of the state.

The constitution thus produced, the fourteenth since the Revolution of 1870, was the issue of a monarchical Assembly forced by circumstances to establish a republic. It was therefore distinguished from others which preceded it in that it contained no declaration of principle and no doctrinal theory. The comparative excellence of the work must be recognized, seeing that it has lasted.

But it owed its duration, as it owed its origin and its character, to the weakness of purpose and to the dissensions of the monarchical parties. The first legal act under the new constitution was the selection by the expiring National Assembly of seventy-five nominated senators, and here the reactionaries gave a crowning example of that folly which has ever marked their conduct each time they have had the chance of scoring an advantage against the Republic. The principle of nomination had been carried in the National Assembly by the Right and opposed by the Republicans. But the quarrels of the Legitimists with the duc de Broglie and his party were so bitter that the brother of the revived house of Orleans was compelled to flee from the country. The princes of the house of Orleans took refuge in Germany, and the other members of the monarchies were compelled to leave the Republic in order to escape persecution. So out of seventy-five senators nominated by the monarchical Assembly, fifty-seven Republicans were chosen. Without this suicidal act the republicans would have been in a woeful minority in the Senate when parliament met in 1876 after the first elections under the new system of parliamentary government. The slight advantage which, in spite of their self-destruction, the reactionaries maintained in the upper house was outbalanced by the republican success at the elections to the Chamber.

In a house of over 500 members only about 150 monarchical deputies were returned, of whom half were Bonapartists. The first cabinet under the new constitution was formed by Dufaure, an old minister of Louis Philippe like Thiers, and like him born in the 18th century. The premier now took the title of president of the council, the chief of the state no longer presiding at the meetings of ministers, though he continued to be present at their deliberations. Although the republican victories at the elections were greatly due to the influence of Gambetta, none of his partisans was included in the ministry, which was composed of members of the two central groups. At the end of 1876 Dufaure retired, but nearly all his ministers retained their portfolios until the fall of the cabinet of Victor Cousin, who first entered political life in the Constituent Assembly of 1848, and was later a leading member of the opposition in the last seven years of the Second Empire.

The premiership of Jules Simon came to an end with the abortive coup d'état of 1877, commonly called from its date the Seize Mai. After the election of Marshal MacMahon to the presidency, the clerical party, irritated at the failure to restore the comte de Chambord, commenced a campaign in favour of the restitution of the temporal power to the Pope. It provoked the Italian government to make common cause with Germany, as Prince Bismarck was likewise attacked by the French clericals for his ecclesiastical policy. At last Jules Simon, who was a liberal most friendly to Catholicism, had to accept a resolution of the Chamber, inviting the ministry to adopt the same disciplinary policy towards the Church which had been followed by the Second Empire and the Monarchy of July. It was on this occasion that Gambetta used his famous expression, "Le cléricalisme, voilà l'ennemi." Some days later a letter appeared in the Journal officiel, dated 16th May 1877, signed by President MacMahon, informing Jules Simon that he had no longer his confidence, as it was clear that he had lost that influence over the Chamber which a president of the Council ought to exercise. The dismissal of the prime minister and the presidential acts which followed did not infringe the letter of the new constitution; yet the proceeding was regarded as a coup d'état in favour of the clerical reactionaries. The duc de
Broglie formed an anti-republican ministry, and Marshal MacMahon, in virtue of the presidential prerogative conferred by the law of 1875, adjourned parliament for a month. When the Chamber reassembled the republican majority of 363 denounced the coalition of parties hostile to the Republic. The president, again using his constitutional prerogative, obtained the authorization of the Senate to dissolve the Chamber. Meanwhile the Broglie ministry had put in practice the policy, favoured by all parties in France, of replacing the functionaries hostile to it with its own partisans. But in spite of the administrative electoral machinery being thus in the hands of the reactionaries, a republican majority was sent back to the Chamber, the sudden death of Thiers on the eve of his expected return to power, and the demonstration at his funeral, which was described as a silent insurrection, adding the rout of the monarchists.

The duc de Broglie resigned, and Marshal MacMahon sent for General de Rochegouet, who formed a cabinet of unknown reactionaries, but it lasted only a few days, as the Chamber refused to vote supply. Dufaure was then called back to office, and his moderate republican ministry lasted for the remainder of the MacMahon presidency. Thus ended the episode of the Seize Mai, condemned by the whole of Europe from its inception. Its chief effects were to prove again to the country the incompetency of the monarchists, and by associating in the public mind the Church with this ill-conceived venture, to provoke reprisals from the anti-clericals when they came into power. After the storm, the year 1878 was one of political repose. The first international exhibition held at Paris after the war displayed to Europe how the secret of France's recuperative power lay in the industry and artistic instinct of the nation. Marshal MacMahon presided with dignity over the fêtes held in honour of the exhibition, and had he pleased he might have tranquilly fulfilled the term of his Septennate. But in January 1879 he made a difference of opinion on a military question in parliament, and Jules Grévy, the president of the Chamber, was elected to succeed him by the Constitutional Assembly, which thus met for the first time under the Constitutional Law of 1875.

Henceforth the executive as well as the legislative power was in the hands of the republicans. The new president was a leader of the bar, who had first become known in the Constituent Assembly of 1848 as the advocate of the principle that a republic would do better without a president. M. Waddington was his first prime minister, and Gambetta was elected president of the Chamber. The latter, encouraged by his rivals in the idea that the time was not ripe for him openly to direct the affairs of the country, thus put himself, in spite of his occult dictatorship, in a position of official self-effacement from which he did not emerge until the jealousies of his own party-colleagues had undermined the prestige he had gained as chief founder of the Republic.

The most active among them was Jules Ferry, minister of Education, who having been a republican deputy for Paris at the end of the Empire, was one of the members of the provisional government proclaimed on 4th September 1870. Borrowing Gambetta's cry that clericalism was the enemy, he commenced the work of reprisal for the Seize Mai. His educational projects of 1879 were thus anti-clerical in tendency, the most famous being article 7 of his education bill, which prohibited members of any "unauthorized" religious orders exercising the profession of teaching in any school in France, the disability being applied to all ecclesiastical communities, excepting four or five which had been privileged by special legislation. This enactment, aimed chiefly at the Jesuits, was advocated with a sectarian bitterness which will be associated with the name of Jules Ferry long after his more statesmanlike qualities are forgotten. This law was rejected by the Senate, Jules Simon being the eloquent champion of the clericals, whose unauthorized orders were then dissolved by decree; but though the forcible expulsion of aged priests and nuns gave rise to painful scenes, it cannot be said that popular feeling was excited in their favour, so grieveously had the Church blundered in identifying itself with the conspiracy of the Seize Mai.

Meanwhile the death of the Prince Imperial in Zululand had shattered the hopes of the Bonapartists, and M. de Freycinet, a former functionary of the Empire, had become prime minister at the end of 1879. He had retained Jules Ferry at the ministry of Education, but unwilling to adopt all his anti-clerical policy, he resigned the premiership in September 1880. The constitution of the first Ferry cabinet secured the further exclusion from office of Gambetta, to which, however, he preferred his "occult dictatorship." In August he had, as president of the Chamber, accompanied M. Grévy on an official visit to Cherbourg, and the acclamations called forth all over France by his speech, which was a hopeful defiance to Germany, encouraged the wily chief of the state to aid the republican conspiracy against the hero of the Republic. In 1881 the only political question before the country was the destiny of Gambetta. His influence in the Chamber was such that in spite of the opposition of the prime minister he carried his electoral scheme of scrutin de liste, descending from the presidential chair to defend it. Its rejection by the Senate caused no conflict between the houses. The check was inflicted not on the Chamber, but on Gambetta, who counted on his popularity to carry the lists of his candidates in all the republican departments in France as a quasi-pelissécrature demonstration in his favour. His rivals dared not openly quarrel with him. There was the semblance of a reconciliation between him and Ferry, and his name was the rallying-cry of the Republic at the general election, which was conducted on the old system of scrutin d'arrondissement.

The triumph for the Republic was great, the combined force of reactionary members returned being less than one-fifth of the new Chamber. M. Grévy could no longer abstain from asking Gambetta to form a ministry, but he had bided his time till jealousy of the "occult power" of the president of the Chamber had undermined his position in parliament. Consequently, on the 14th of November 1881 Gambetta announced the composition of his cabinet, ironically called the "grand ministère," which was to consolidate the Republic and to be the apotheosis of its chief, a great feeling of disillusion fell on the country, for his colleagues were untried politicians. The best known was Paul Bert, a man of science, who as the "reporter" in the Chamber of the Ferry Education Bill had distinguished himself as an aggressive free-thinker, and inappropriately was named minister of public worship. All the conspicuous republicans who had held office refused to serve under Gambetta. His cabinet was condemned in advance. His enemies having succeeded in ruining its composition, declared that the construction of a one-man machine was ominous of dictatorship, and the "grand ministère" lived for only ten weeks. Gambetta was succeeded in January 1882 by M. de Freycinet, who having taken office in the Dufaure cabinet of 1877, and having continued to hold office at intervals until 1889, was the most successful specimen of a "ministre libre." Death of Gambetta.

Gambetta's death was followed by a period of anarchy, during which Prince Napoleon, the son of Jerome, king of Westphalia, placarded the walls of Paris with a manifesto. The Chamber thereupon voted the exile of the members of the families which
had reigned in France. The Senate rejected the measure, and a conflict arose between the two houses. M. Duclerc resigned the premiership in January 1883 to his minister of the Interior, M. Fallières, a Gascon lawyer, who became president of the Senate in 1890 and president of the Republic in 1906. He held office for three weeks, when Jules Ferry became president of the council for the second time. Several of the closest of Gambetta’s friends accepted office under the old enemy of their chief, and the new combination adopted the epithet “opportunist,” which had been invented by Gambetta in 1875 to justify the expediency of his alliance with Thiers. The Opportunists thenceforth formed an important group standing between the Left Centre, which was now excluded from office, and the Radicals. It claimed the tradition of Gambetta, but the guiding principle manifested by its members was that of securing the spoils of place. To this end it often allied itself with the Radicals, and the Ferry cabinet practised this policy in 1883 when it removed the Orleanist princes from the active list in the army as the illogical result of the demonstration of a Bonaparte. How needless was this proceeding was shown a few months later when the comte de Chambord died, as his death, which finally fused the Royalists with the Orleanists, caused no commotion in France.

The year 1884 was unprecedented seeing that it passed without a change of ministry. Jules Ferry displayed real administrative ability, and as an era of steady government seemed to be commencing, the opportunity was taken to revise the Constitution. The two Chambers therefore met in congress, and enacted that the republican form of government could never be the subject of revision, and that all members of families which had reigned in France were ineligible for the presidency of the Republic—a repetition of the adventure of Louis Bonaparte in the middle of the century being thus made impossible. It also decided that the clauses of the law of 1875 relating to the organization of the Senate should no longer have a constitutional character. This permitted the reform of the Upper House by ordinary parliamentary procedure. So an organic law was passed to abolish the system of nominating senators, and to increase the number of municipal delegates in the electoral colleges in proportion to the population of the communes. The French nation, for the first time since it had enjoyed political life, had revised a constitution by pacific means without a revolution. Gambetta being out of the way, his favourite electoral system of scrutin de liste had no longer any terror for his rivals, so it was voted by the Chamber early in 1883. Before the Senate had passed it into law the Ferry ministry had fallen at the end of March, after holding office for twenty-five months, a term rarely exceeded in the annals of the Third Republic. This long tenure of power had excited the dissatisfaction of jealous politicians, and the news of a slight disaster to the French troops in Tongking called forth all the pent-up rancour which Jules Ferry had inspired in various groups. By the exaggerated news of defeat Paris was excited to the brink of a revolution. The approaches of the Chamber were invaded by an angry mob, and Jules Ferry was the object of public hate more bitter than any man had called forth in France since Napoleon III. on the days after Sedan. Within the Chamber he was attacked in all quarters. The Radicals took the lead, supported by the Nationalists. They remembered the anti-clerical rigour of the Ferry laws, by the Left Centre, not sorry for the tribulation of the group which had supplanted it, and by place-hunting republicans of all shades. The attack was led by a politician who disdained office. M. Georges Clément, who had originally come to Paris from the Vendée as a doctor, had as a radical leader in the Chamber used his remarkable talent as an overthrower of ministries, and nearly every one of the eight ministerial crises which had already occurred during the presidency of Grévy had been hastened by his mendiant eloquence.

The next prime minister was M. Brisson, a radical lawyer and journalist, who in April 1885 formed a cabinet of “concentration”—that is to say, it was recruited from various groups with the idea of concentrating all republican forces in opposition to the reactionaries. M.M. de Freycinet and Carnot, afterwards president of the Republic, represented the moderate element in this ministry, which superintended the general elections under scrutin de liste. That system was recommended by its advocates as a remedy for the rapid decadence in the composition of the Chamber. Manhood suffrage, which had returned to the National Assembly a distinguished body of men to conclude peace with Germany, had chosen a very different type of representative to sit in the Chamber created by the constitution of 1875. At each succeeding election the standard of deputies returned grew lower, till Gambetta described them contemptuously as “sous-vétérinaires,” indicating that they were chiefly chosen from the petty professional class, which represented neither the real democracy nor the material interests of the country. His view was that the election of members by departmental lists would ensure the candidature of the best men in each region, who under the system of single-member districts were apt to be neglected in favour of local politicians representing narrow interests. When his death had removed the fear of his using scrutin de liste as a plebiscitary organization, parliament sanctioned its trial. The result was not what its promoters anticipated. The composition of the Chamber was indeed transformed, but only by the substitution of reactionary deputies for republicans. Of the votes polled, 45% were given to the Monarchists, and if they had obtained one-half of the abstentions the Republic would have come to an end. At the same time the character of the republican deputies returned was not improved; so the sole effect of scrutin de liste was to show that the electorate, weary of republican dissensions, was ready to make a trial of monarchical government, if only the reactionary party proved that it contained statesmen capable of leading the nation. So menacing was the situation that the republicans thought it wise not further to expose their divisions in the presidential election which was due to take place at the end of the year. Consequently, on the 28th of December 1885, M. Grévy, in spite of his growing unpopularity, was elected president of the Republic for a second term of seven years.

The Brisson cabinet at once resigned, and on the 7th of January 1886 its most important member, M. de Freycinet, formed his third ministry, which had momentous influence on the future history of the Republic. The new minister of war General Boulanger, was General Boulanger, a smart soldier of no remarkable military record; but being the nominee of M. Clément, he began his official career by taking radical measures against commanding officers of reactionary tendencies. He thus aided the government in its campaign against the families which had reigned in France, whose situation had been improved by the result of the elections. The fêtes given by the comte de Paris to celebrate his daughter’s marriage with the heir-apparent of Portugal moved the republican majority in the Chambers to expel from France the heads of the houses of Orleans and of Bonaparte, with their eldest sons. The names of all the princes on the army list were erased from it, the decree being executed with unseemly ostentation by General Boulanger, who had owed early promotion to the protection of the duc d’Aumale, and on that prince protesting he was exiled too. Meanwhile General Boulanger took advantage of Grévy’s unpopularity to make himself a hero, and at the review, held yearly on the 14th of July, the anniversary of the fall of the Bastille, his acclamation by the Parisian mob showed that he was taking an unexpected place in the imagination of the people. He continued to work with the Radicals, so when they turned out M. de Freycinet in December 1886, one of their group, M. Goblet, a lawyer from Amiens, formed a ministry, and retained Boulanger as minister of war. M. Clément, however, withdrew his support from the general, who was nevertheless loudly patronized by the violent radical press. His bold attitude towards Germany in connexion with the arrest on the German frontier of a French official named Schnaebélé so roused the enthusiasm of the public, that M.Goblet was not sorry to resign in May 1887 in order to get rid of his too popular colleague.
To form the twelfth of his ministries, Grévy called upon M. Rouvier, an Opportunist from Marseilles, who had first held office in Gambetta’s short-lived cabinet. General Boulanger was sent to command a corps d’arme at Clermont-Ferrand; but the popular press and the people clamoured for the hero who was said to have terrorized Prince Bismarck, and they encouraged him to play the part of a plebiscitary candidate. There were grave reasons for public discontent. Parliament in 1887 was more than usually sterile in legislation, and in the autumn session it had to attend to a scandal which had long been rumoured. The son-in-law of Grévy, Daniel Wilson, a prominent deputy who had been an undersecretary of state, was accused of trafficking in the decoration of the Legion of Honour, and of using the Elysée, the president’s official residence, where he lived, as an agency for his corrupt practices. The evidence against him was so clear that his colleagues in the Chamber put the government into a minority in order to precipitate a presidential crisis, and on Grévy refusing to accept this hint, a long array of politicians, representing all the republican groups, declined his invitation to aid him in forming a new ministry, all being bent on forcing his resignation. Had General Boulanger been a man of resolute courage he might at this crisis have made a coup d’état, for his popularity in the street and in the army increased as the Republic sank deeper into scandal and anarchy. At last, when Paris was on the brink of revolution, Grévy was prevailed on to resign. The candidates for his succession to the presidency were two ex-prime ministers, MM. Ferry and de Freycinet, and Floquet, a barrister, who had been conspicuous in the National Assembly for his sympathy with the Commune. The Monarchists had no candidate ready, and resolved to vote for Ferry, because they believed that if he were elected his unpopularity with the democracy would cause an insurrection in Paris and the downfall of the Republic. MM. de Freycinet and Floquet each looked for the support of the Radicals, and each had made a secret compact, in the event of his election, to restore General Boulanger to the war office. But M. Clémenceau, fearing the election of Jules Ferry, advised his followers to vote for an outsider, and after some manoeuvring the candidate elected by a large majority Sadi Carnot.

The new president, though the nominee of chance, was an excellent choice. The grandson of Lazare Carnot, the "organizer of victory" of the Convention, he was also a man of unsullied probity. The tradition of his family name, only less glorious than that of Bonaparte in the annals of the Revolution, was welcome to France, almost ready to throw herself into the arms of a soldier of fortune, while his blameless repute reconciled some of those whose opposition to the Republic had been quickened by the mean vices of Grévy. But the name and character of Carnot would have been powerless to check the Boulanger movement without the incompetency of its leader, who was getting the democracy at his back without knowing how to utilize it. The new president’s first prime minister was M. Tirard, a senator who had held office in six of Grévy’s ministries, and he formed a cabinet of politicians as colourless as himself. The early months of 1887 were occupied with the trial of Wilson, who was sentenced to two years’ imprisonment for fraud, and with the conflicts of the government with General Boulanger, who was deprived of his command for coming to Paris without leave, and General Boulanger was elected deputy for the department of the Aisne by an enormous majority. It so happened that the day after his election a presidential decree was signed on the advice of the minister of war removing General Boulanger from the army, and the court of appeal quashed Wilson’s conviction. Public feeling was profoundly moved by the coincidence of the release of the relative of the ex-president by the judges of the Republic on the same day that its ministers expelled from the army the popular hero of universal suffrage.

As General Boulanger had been invented by the Radicals it was thought that a Radical cabinet might be a remedy to cope with him, so M. Floquet became president of the council in April 1888, M. de Freycinet taking the portfolio of war, which he retained through many ministries. M. Floquet’s chief achievement was a duel with General Boulanger, Boulangerism, in which, though an elderly civilian, he wounded him. Nothing, however, checked the popularity of the military politician, and though he was a failure as a speaker in the Chamber, several departments returned him as their deputy by great majorities. The Bonapartists had joined him, and while in his manifestos he described himself as the defender of the Republic, the mass of the Monarchists, with the consent of the comte de Paris, entered the Boulangerist camp, to the dismay both of old-fashioned Royalists and of many Orleanists, who resented his recent treatment of the duc d’Aumale. The centenary of the taking of the Bastille was to be celebrated in Paris by an international exhibition, and it appeared likely that it would be inaugurated by General Boulanger, so irresistible seemed his popularity. In January 1889 he was elected member for the metropolitan department of the Seine with a quarter of a million votes, and by a majority of eighty thousand over the candidate of the government. Had he marched on the Elysée the night of his election, nothing could have saved the parliamentary Republic, but again he let his challenge hang in the air, and proposed the restoration of scrutin d’arrondissement as the electoral system for scrutin de liste. The change was rapidly enacted by the two Chambers, and was a significant commentary on the respective advantages of the two systems. M. Tirard was again called to form a ministry, and he selected as minister of the interior M. Constan, originally a professor at Toulouse, who had already proved himself a skilful manipulator of elections when he held the same office in 1881. He was therefore given the supervision of the machinery of centralization with which it was supposed that General Boulanger would have to be fought at the general election. That incomplete hero, however, saved all further trouble by flying the country when he heard that his arrest was imminent. The government, in order to prevent any plebiscitary manifestation in his favour, passed a law forbidding a candidate to present himself for a parliamentary election in more than one constituency; it also arranged the general on the charge of treason before the Senate sitting as a high court, and he was sentenced to two years in prison. Such measures were needless. The flight of General Boulanger was the death of Boulangerism. He alone had saved the Republic which had done nothing to save itself. Its government had, on the contrary, displayed throughout the crisis an anarchic feebleness and incoherency which would have speeded its end had the leader of the plebiscitary movement possessed sagacity or even common courage.

The elections of 1889 showed how completely the reactionaries had compromised their cause in the Boulanger failure. Instead of 45% of the votes polled as in 1885, they obtained only 21%, and the comte de Paris, the pretender of constitutional monarchy, was irrevocably prejudiced by his alliance with the military adventurer who had outraged the princes of his house. A period of calm succeeded the storm of Boulangerism, and for the first time under the Third Republic parliament set to work to produce legislation useful for the state, without rousing party passion, as in its other period of activity when the Ferry education laws were passed. Before the elections of 1889 the reform of the army was undertaken, the general term of active compulsory service was made three years, while certain classes hitherto dispensed from serving, including ecclesiastical seminarians and lay professors, had henceforth to undergo a year’s military training. The new parliament turned its attention to social and labour questions, as the only clouds on the political horizon were the serious strikes in the manufacturing districts, which displayed the growing political organization of the socialist party. Otherwise nothing disturbed the calm of the country. The young duc d’Orléans vainly tried to ruffle it by breaking his exile in order to claim his citizen’s right to perform his military service. The cabinet was rearraigned in March 1890, M. de Freycinet becoming prime minister for the fourth time, and
FRANCE

[History]

retaining the portfolio of war. All seemed to point to the consolidation of the Republic, and even the Church made signals of reconciliation. Cardinal Lavigerie, a patriotic missionary and statesman, attempted to get the tinge at Algiers, and proposed the toast of the Republic to the tune of the "Marseillaise" played by his pères blancs. The royalist Catholics protested, but it was soon intimated that the archbishop of Algiers' demonstration was approved at Rome. The year 1891 was one of the few in the annals of the Republic which passed without a change of ministry, but the agitations of 1892 were to counterbalance the repose of the two preceding years.

The first crisis arose out of the peacemaking policy of the Pope. Following up his intimation to the archbishop of Algiers, Leo XIII. published in February 1892 an encyclical, bidding French Catholics accept the Republic as the firmly established form of government. The papal injunction produced, a new political group called the "Rallîés," the majority of its members being Monarchists who rallied to the Republic in obedience to the Vatican. The most conspicuous among them was Comte Albert de Mun, an eloquent exponent in the Chamber of legitimism and Christian socialism. The extreme Left mistrusted the adhesion of the new converts to the Republic, and ecclesiastical questions were the constant subjects of acrimonious debates in parliament. In the course of one of them M. de Freycinet found himself in a minority. He ceased to be prime minister, being succeeded by M. Loubet, a lawyer from Montpellier, who had previously held office for three months in the first Tirard cabinet; but M. de Freycinet continued to hold his portfolio of war. The confusion of the republican groups kept pace with the disarray of the reactionaries, and outside parliament the frequency of anarchist outrages did not increase public confidence. The only figure in the Republic which grew in prestige was that of M. Carnot, who in his frequent presidential tours dignified his office, though his modesty made him unduly efface his own personality.

When the autumn session of 1892 began all other questions were overwhelmed by the bursting of the Panama scandal. The company associated for the piecing of the Isthmus of Panama, undertaken by M. de Lesseps, the maker of the Suez Canal, had become insolvent some years before. Fifty millions sterling subscribed by the thirst of France had disappeared, but the rumours involving political personages in the disaster were so confidently asserted to be reactionary libels, that a minister of the Republic, afterwards sent to penal servitude for corruption, obtained damages for the publication of one of them. It was known that M. de Lesseps was to be tried for misappropriating the money subscribed; but considering the vast sums lost by the public, little interest was taken in the matter till it was suddenly stirred by the dramatic suicide of a well-known Jewish financier closely connected with republican politicians, driven to death, it was said, by menaces of blackmail. Thereupon a period of terror in political circles. Every one who had a grudge against an enemy found vent for it in the press, and the people of Paris lived in an atmosphere of delation. Unhappily it was true that ministers and members of parliament had been subsidized by the Panama company. Floquet, the president of the Chamber, avowed that when prime minister he had laid hands on £12,000 of the company's funds for party purposes, and his justification of the act threw a light on the code of public morality of the parliamentary Republic. Other politicians were more seriously implicated on the charge of having accepted subsidies for their private purposes, and emotion reached its height when the cabinet ordered the prosecution of two of its members for corrupt traffic of their offices. These two ministers were afterwards discharged, and they seem to have been accused with recklessness; but their prosecution by their own colleagues proved that the statesmen of the Republic believed that their high political circles were sapped with corruption. Finally, only twelve senators and deputies were committed for trial, and the only one convicted was a minister of M. de Freycinet's third cabinet, who pleaded guilty to receiving large bribes from the Panama company. The public regarded the convicted politician as a scapegoat, believing that there were numerous delinquents in parliament, more guilty than he, who had not even been prosecuted. This feeling was aggravated by the sentence passed, but afterwards remitted, by M. Loubet. M. de Lesseps was one of the most involved French people in misfortune only because he too was so singularly devoted to the triumph he had achieved for France by his great work in Egypt.

Within the nation the moral result of the Panama affair was a general feeling that politics had become under the Republic a profession unworthy of honest citizens. The sentiment evoked by the scandal was one of sceptical lassitude rather than indignation. The reactionaries had crowned their record of political incompetence. At a crisis which gave legitimate opportunity to a respectable and patriotic Opposition they showed that the country had nothing to expect from them but incoherent and exaggerated invective. If the scandal had come to light in the time of General Boulanger the parliamentary Republic would not have survived it. As it was, the sordid story did little more than produce severe changes of ministry. M. Loubet resigned the premiership in December 1892 to M. Ribot, a former functionary of the Empire, whose ministry lived for three stormy weeks. On the first day of 1893 M. Ribot formed his second cabinet, which survived till the end of March, when he was succeeded by his minister of education, M. Charles Dupuy, an ex-prosecutor who had never held office till four months previously. M. Dupuy, having taken the portfolio of the interior, supervised the momentous election of 1893, which took place amid the profound indifference of the population, except in certain localities where personal antagonisms excited violence. An intelligent Opposition would have roused the country at the polls against the regime compromised by the Panama affair. Nothing of the sort occurred, and the electorate preferred the doubtful probity of their republican representatives to the certain incompetence of the reactionaries. The adversaries of the Republic polled only 16% of the votes recorded, and the chief feature of the election was the increased return of socialist and radical-socialist deputies. When parliament met it turned out the Dupuy ministry, and M. Casimir-Périer quitted the presidency of the Chamber to take his place. The new prime minister was the bearer of an eminent name, being the grandson of the statesman of 1831, and the great-grandson of the owner of Viselle, where the estates of Dauphiné met in 1878, as a prelude to the assembling of the states-general the year next. His acceptance of office aroused additional interest because he was a minister possessed of independent wealth, and therefore a rare example of a French politician free from the imputation of making a living out of politics. Neither his repute nor his qualities gave long life to his ministry, which fell in four months, and M. Dupuy was sent for again to form a cabinet in May 1894.

Before the second Dupuy ministry had been in office a month President Carnot died by the knife of an anarchist at Lyons. He was perhaps the most estimable politician of the Third Republic. Although the standard of political life was not elevated under his presidency, he at all events set a good personal example, and to have filled unscathed the most conspicuous position in the land during a period unprecedented for the scurility of libels on public men was a testimony to his blameless character. As the term of his septennate was near, parliament was not unprepared for a presidential election, and M. Casimir-Périer, who had been spoken of as his possible successor, was elected by the Congress which met at Versailles on the 27th of June 1894, three days after Carnot's assassination. The election of one who bore respectively a name not less distinguished in history than that of Carnot seemed to ensure that the Republic would reach the end of the century under the headship of a president of exceptional prestige. But instead of remaining chief of the state for seven years, in less than seven months M. Casimir-Périer astonished France and Europe by his resignation. Scurrily defamed by the socialist press, the new president found that the Republicans in the Chamber were not disposed to defend him in his high office; so, on the 15th of January 1895, he seized
the occasion of the retirement of the Dupuy ministry to address a message to the two houses intimating his resignation of the presidency, which, he said, was endowed with too many responsibilities and not sufficient powers.

This time the Chambers were unprepared for a presidential vacancy, and to fill it in forty-eight hours was necessarily a matter of haphazard. The choice of the congress fell on Félix Faure, a merchant of Havre, who, though minister of marine in the retiring cabinet, was one of the least-known politicians who had held office. The selection was a good one, and introduced to the presidency a type of politician unfortunately rare under the Third Republic—a successful man of business. Félix Faure had a fine presence and polished manners, and having risen from a humble origin he displayed in his person the fact that civilization descends to a lower social level in France than elsewhere. Although he was in a sense a man of the people the Radicals and Socialists in the Chambers had voted against him. Their candidate, like almost all democratic leaders in France, had never worked with his hands—M. Brisson, the son of an attorney at Bourges, a member of the Parisian bar, and perpetual candidate for the presidency. Nevertheless the Left tried to take possession of President Faure. His first ministry, composed of moderate Republicans and presided over by M. Ribot, lasted until the autumn session of 1895, when it was turned out and a radical cabinet was formed by M. Léon Bourgeois, an ex-functionary, who when a prefect had been suspected of reactionary tendencies.

The Bourgeois cabinet of 1895 was remarkable as the first ministry formed since 1877 which did not contain a single member of the outgoing cabinet. It was said to be exclusively radical in its composition, and thus to indicate that the days of “republican concentration” were over, and that the Republic, being firmly established, an era of party government on the English model had arrived. The new ministry, however, on analysis did not differ in character from any of its predecessors. Seven of its members were old office-holders of the ordinary “ministerial” type. The most conspicuous was M. Cavaignac, the son of the general who had opposed Louis Bonaparte in 1848, and the grandson of J. B. Cavaignac, the regicide member of the Convention. Like Carnot and Casimir-Périer, he was, therefore, one of those rare politicians of the Republic who possessed some hereditary tradition. An ambitious man, he was now classed as a Radical on the strength of his advocacy of the income-tax, the principle of which has never been popular in France, as being adverse to the secretive habits of thrift cultivated by the people, which are a great source of the national wealth. The radicalism of the rest of the ministry was not more alarming in character, and its tenure of office was without legislative result. Its fall, however, occasioned the only constitutionally interesting ministerial crisis of the twenty-four which had taken place since Grévy’s election to the presidency sixteen years before. The Senate, disliking the fiscal policy of the government, refused to vote supply in spite of the support which the Chamber gave to the ministry. The government was almost at the point of the revolutionary rising which the Radicals predicted, and the Senate actually forced the Bourgeois cabinet to resign amid profound popular indifference.

The new prime minister was M. Mélée, who began his long political career as a member of the Commune in 1871, but was so little compromised in the insurrection that Jules Simon gave him an under-secretaryship in his ministry of 1876. After that he was once a cabinet minister, and was for a year president of the Chamber. He was chiefly known as a protectionist; but it was as leader of the Progressists, as the Opportunists now called themselves, that he formed his cabinet in April 1886, which was announced as a moderate ministry opposed to the policy of the Radicals. It is true that it made no attempt to tax incomes, but otherwise its achievements did not differ from those of other ministries, radical or concentation, except in its long survival. It lasted for over two years, and lived as long as the second Ferry cabinet. Its existence was prolonged by certain incidents of the Franco-Russian alliance. The visit of the Tsar to Paris in October 1896, being the first official visit paid by a European sovereign to the Republic, helped the government over the critical period at which ministries usually succumbed, and it was further strengthened in parliament by the invitation to the president of the Republic to return the imperial visit at St Petersburg in 1897. The Chamber came to its normal term that autumn; but a law had been passed fixing May as the month for general elections, and the ministry was allowed to retain office till the dissolution at Easter 1898.

The long duration of the Mélée government was said to be a further sign of the arrival of an era of party government with its essential accomplishment, ministerial stability. But in the country there was no corresponding sign that the electorate was being organized into two parties of Progressists and Radicals; while in the Chamber it was ominously observed that persistent opposition to the moderate ministry came from nominal supporters of its views, who were dismayed at one small band of fellow-politicians monopolizing office for two years. The last election of the century was therefore fought on a confused issue, the most tangible results being the reduction of the Monarchists, who secured only 12% of the total poll, and the advance of the Socialists, who obtained nearly 26% of the votes recorded. The Radicals returned were less numerous than the Moderates, but with the aid of the Socialists they nearly balanced them. A new group entitled Nationalist made its appearance, supported by a miscellaneous electorate representing the malcontent element in the nation of all political shades from monarchist to revolutionary socialist. The Chamber, so composed, was as incoherent as either of its predecessors. It refused to elect the radical leader M. Brisson as its president, and then refused its confidence to the moderate leader M. Mélée. M. Brisson, the rejected of the Chamber, was sent for to form a ministry, on the 28th of June 1898, which survived till the adjournment, only to be turned out when the autumn session began. M. Charles Dupuy thus became prime minister for the third time with a cabinet of the old concentration pattern, and for the third time in less than five years under his premiership the Presidency of the Republic became vacant. Félix Faure had increased in pomposity rather than in popularity. His contact with European sovereigns seems to have made him over-conscious of his superior rank, and he cultivated habits which austere republicans make believe to be the monopoly of frivolous courts. The regular domesticity of middle-class life may not be disturbed with impunity when age is advancing, and Félix Faure died with tragic unexpectedness on the 16th of February 1899. The joys of his high office were so dear to him that nothing but death would have induced him to lay it down before the term of his septennate. There was therefore no candidate in waiting for the vacancy; and as Paris was in an agitated mood the majority in the Congress elected M. Loubet president of the Republic, because he happened to hold the second place of dignity in the state, the presidency of the Senate, and was, moreover, a politician who had shown no hesitation to act as an adversary of plebiscitary pretensions. His only competitor was M. Mélée, whose ambitions were not realized, in spite of the alliance of his Progressist supporters with the Monarchists and Nationalists. The Dupuy ministry lasted till June 1899, when a new cabinet was formed by M. Waldeck-Rousseau, who, having held office under Gambetta and Jules Ferry, had relinquished politics for the bar, of which he had become a distinguished leader. Though a moderate republican, he was the first prime minister to give portfolios to socialist politicians. This was the distinguishing feature of the last cabinet of the century—the thirty-seventh which had taken office in the twenty-six years which had elapsed since the resignation of Thiers in 1873.

It is now necessary to go back a few years in order to refer to a matter which, though not political in its origin, in its development filled the whole political atmosphere of France in the closing period of the 19th century. Soon after the Boulanger movement a journal was founded at Paris called
Libre Parole. Its editor, M. Drumont, was known as the author of *La France juive*, a violent anti-Semitic work, written to denounced the influence exercised by Jewish financiers in the politics of the Third Republic. It may be said to have started the anti-Semitic movement in France, where hostility to the Jews had not the pretext existing in those lands which contain a large Jewish population exercising local rivalry with the natives of the soil, or spoiling them with usury. That state of things existed in Algeria, where the indigenous Jews were made French citizens during the Franco-Prussian War to secure their support against the Arabs in rebellion. But political anti-Semitism was introduced into Algeria only as an offshoot of the movement in continental France, where the great majority of the Jewish community were of the same class as the politicians of the Republic. Primarily directed against the Jewish financiers, the movement was originally looked upon as a branch of the anti-capitalist propaganda of the Socialists. Thus the *Libre Parole* joined with the revolutionary press in attacking the repressive legislation provoked by the dynamite outrages of the anarchists, clerical reactionaries who supported it being as scrupulously abused by the anti-Semitic organ as its republican authors. The Panama affair, in the exposure of which the *Libre Parole* took a prominent part soon after its foundation, was also a bond between anti-Semitism and Socialism, to whom, however, the *Monde* was always incapable of acting alone, united their forces. The implication of certain Jewish financiers with republican politicians in the Panama scandal aided the anti-Semites in their special propaganda, of which a main thesis was that the government of the Third Republic had been organized by its venal politicians for the benefit of Jewish immigrants from Germany, who had thus enriched themselves at the expense of the laborious and unsuspecting French population. The *Libre Parole*, which had become a popular organ with reactionaries and with malcontents of all classes, enlisted the support of the Catholics by attributing the anti-religious policy of the Republic to the influence of the Jews, skilfully reviving bitter memories of the enactment of the Ferry decrees, when sometimes the laicization of schools or the expulsion of monks and nuns had been carried out by a Jewish functionary. Thus religious sentiment and race prejudice were introduced into a movement which was at first directed against capital; and the campaign was conducted with the weapons of scurrility and defamation which had made an unlicensed press under the Third Republic a demoralizing national evil.

An adroit feature of the anti-Semitic campaign was an appeal to national patriotism to rid the arms of Jewish influence. The editors said, in concert with directing the financial, and thereby the general policy of the Republic, had designs on the French army, in which they wished to act as secret agents of their German kindred. In October 1894 the *Libre Parole* announced that a Jewish officer of artillery attached to the general staff, Captain Alfred Dreyfus, had been arrested on the charge of supplying a government of the Triple Alliance with French military secrets. Tried by court-martial, he was sentenced to military degradation and to detention for life in a fortress. He was publicly degraded at Paris in January 1895, a few days before Casimir-Périer resigned the presidency of the Republic, and was transported to the Île du Diable on the coast of French Guiana. His conviction, on the charge of having betrayed to a foreign power documents relating to the national defence, was based on the alleged identity of his handwriting with that of an intercepted covering-letter, which contained a list of the papers treasonably communicated. The possibility of his innocence was not raised outside the circle of his friends; the Socialists, who subsequently defended him, even complained that common soldiers were shot for offences less than that for which the ringleader whom they had only transported. The secrecy of his trial did not shock public sentiment in France, where at that time all civilians charged with crime were interrogated by a judge in private, and where all accused persons are presumed guilty until proved innocent. In a land subject to invasion there was less disposition to criticize the decision of a military tribunal sitting in the defence of the nation event than there would have been in the case of a doubtful judgment passed in a civil court. The country was practically unanimous that Captain Dreyfus had got his deserts. A few, indeed, suggested that he had not been a Jew he would never have been accused; but the greater number replied that an ordinary French traitor of Gentile birth would have been forgotten from the moment of his condemnation. The pertinacity with which some of his co-religionists set to work to show that he had been irregularly condemned seemed to justify the latter proposition. But it was not a Jew who brought about the revival of the affair. Colonel Picquart, an officer of great promise, became head of the intelligence department at the war office, and in 1896 informed the minister of his suspicion that the letter on which Dreyfus had been condemned was written by a certain Major Esterhazy. The military authorities, not wishing to have the case reopened, sent Colonel Picquart on foreign service, and put in his place Colonel Henry. The all-seeing press published various versions of the incident, and the anti-Semitic journals denounced them as proofs of a Jewish conspiracy against the French army.

At the end of 1897 M. Scheurer-Kestner, an Alsatian devoted to France and a republican senator, tried to persuade his political friends to reopen the case; but M. Méline, the prime minister, declared in the name of the Republic that the Dreyfus affair no longer existed. The fact that the anti-Semitic senator who championed Dreyfus was a Protestant encouraged the clerical press in its already marked tendency to utilize anti-Semitism as a weapon of ecclesiastical warfare. But the religious side-issues of the question would have had little importance had not the army been involved in the controversy, which had become so keen that all the population, outside that large section of it indifferent to all public questions, was divided into "Dreyfusards" and "anti-Dreyfusards." The strong position of the latter was due to their assuming the position of defenders of the army, which, at an epoch when neither the legislature nor the government inspired respect, and the Church was the object of polemic, was the only institution in France to unite the nation by appealing to its martial and patriotic instincts. That is the explanation of the enthusiasm of the public for generals and other officers by whom the trial of Dreyfus and subsequent proceedings had been conducted in a manner repugnant to those who do not favour the arbitrary ways of military dictatorship, which, however, are not unpopular with the French; the acquittal of Major Esterhazy by an open verdict, the conviction of Zola by a civil tribunal for a violent criticism of the military authorities, and the imprisonment without trial of Colonel Picquart for his efforts to exonerate Dreyfus, were practically approved by the nation. This was shown by the result of the general elections in May 1898. The clerical reactionaries were almost swept out of the Chamber, but the overwhelming republican majority was practically united in its hostility to the defenders of Dreyfus, whose only outspoken representatives were found in the socialist groups. The moderate Méline ministry was succeeded in June 1898 by the radical Brisson ministry. But while the new prime minister was said to be personally disposed to revise the sentence on Dreyfus, his civilian minister of war, M. Cavaignac, was as hostile to revision as any of his military predecessors—General Mercier, under whom the trial took place, General Zurlfinden, and General Billot, a republican soldier devoted to the parliamentary régime.

The radical minister of war in July 1898 laid before the Chamber certain new proofs of the guilt of Dreyfus, in a speech so convincing that the house ordered it to be placarded in all the communes of France. The next month Colonel Henry, the chief of the intelligence department, brought to light new proofs of those new proofs, and then committed suicide. M. Cavaignac thereupon resigned office, but declared that the crime of Henry did not prove the innocence of Dreyfus. Many, however, who had hitherto accepted the judgment of 1894, reflected that the offence of a guilty man did not need new crime for its proof. It was further remarked that
the foray was committed by the intimate colleague of the officers of the general staff, who had zealously protected Esterhazy, the suspected author of the document on which Dreyfus had been convicted. An uneasy misgiving became widespread; but partisan spirit was too excited for it to cause a general revulsion of feeling. Some journalists and politicians of the extreme Left had adopted the defence of Dreyfus as an anti-clerical movement in response to the intemperate partisanship of the Catholic press on the other side. Other members of the socialist groups, not content with criticizing the conduct of the military authorities in the Dreyfus affair, opened a general attack on the French army,—an unpopular policy which allowed the anti-Dreyfusards to utilize the old revolutionary device of making the word “patriotism” a party cry. The defamation and rancour with which the press on both sides flooded the land obscured the point at issue. However, the Brisson ministry just before its fall remitted the Dreyfus judgment to the criminal division of the cour de cassation—the supreme court of revision in France. M. Dupuy formed a new cabinet in November 1898, and made M. de Freycinet minister of war, but that adroit officer, a Belgian by birth, was not favourable to the anti-military and anti-clerical defenders of Dreyfus. The refusal of the Senate, the stronghold of the Republic, to re-elect M. Scheurer-Kestner as its vice-president, showed that the opportunistic president of war understood the feeling of parliament, which was soon displayed by an extraordinary proceeding. The divisional judges, to whom the case was remitted, showed signs that their decision would be in favour of a new trial of Dreyfus. The republican legislature, therefore, disregarding the principle of the separation of the powers, which is the basis of constitutional government, took the arbitrary step of interfering with the judicial authority. It actually passed a law withdrawing the partly-heard cause from the criminal chamber of the cour de cassation, and transferring it to the full court of three divisions, in the hope that a majority of judges would thus be found to decide against the revision of the sentence on Dreyfus.

This flagrant confusion of the legislative with the judicial power displayed once more the incompetence of the French right to use parliamentary institutions; but it left the nation indifferent. It was during the passage of the bill that the president of the Republic suddenly died. Félix Faure was said to be hostile to the defenders of Dreyfus and disposed to utilize the popular enthusiasm for the army as a means of making the presidential office independent of parliament. The Chambers, therefore, in spite of their anti-Dreyfusard bias, were determined not to relinquish any of their constitutional prerogative. The military and plebiscitary parties were now fomenting the public discontent by noisy demonstrations. The president of the Senate, M. Loubet, as has been mentioned, was known to have no sympathy with this agitation, so he was elected president of the Republic by a large majority at the congress held at Versailles on 18th February 1899. The new president, who was unknown to the public, though he had once been prime minister for nine months, was respected in political circles; but his elevation to the first office of the State made him the object of that defamation which had become the chief characteristic of the partisan press under the Third Republic. He was recklessly accused of having been an accomplice of the Panama frauds, by screening certain guilty politicians when he was prime minister in 1892, and because he was not opposed to the revision of the Dreyfus sentence he was wantonly charged with being bought with Jewish money. Meanwhile the united divisions of the cour de cassation were, in spite of the intimidation of the legislature, reviewing the case with an independence worthy of praise in an ill-paid magistracy which owed its promotion to political influence. Instead of justifying the suggestive interference of parliament it revised the judgment of the court-martial, and ordered Dreyfus to be re-tried by a military tribunal at Rennes. The Dupuy ministry, which had wished to prevent this decision, resigned, and M. Waldeck-Rousseau formed a heterogeneous cabinet in which Socialists, who for the first time took office, had for their colleague as minister of war General de Galliffet, whose chief political fame had been won as the executioner of the Communards after the insurrection of 1871. Dreyfus was brought back from the Devil’s Island, and in August 1899 was put upon his trial a second time. His old accusers, led by General Mercier, the minister of war of 1894, redoubled their efforts to prove his guilt, and were permitted by the officers composing the court a wide license according to English ideas of criminal jurisprudence. The published evidence did not, however, seem to connect Dreyfus with the charges brought against him. Nevertheless the court, by a majority of five to two, found him guilty, and with illogical inconsequence added that there were in his reason extenuating circumstances. He was sentenced to ten years’ detention, and while it was being discussed whether the term he had already served would count as part of his penalty, the ministry completed the inconsequence of the situation by advising the president of the Republic to pardon the prisoner. The result of the second trial satisfied neither the partisans of the accused, who desired his rehabilitation, some of them reproaching him for accepting a pardon, nor his adversaries, whose vindictiveness was unassuaged by the pardon which he had already suffered. The great mass of the French people, who had come to treat a public question with indifference, were glad to be rid of a controversy which had for years infected the national life.

The Dreyfus affair was severely judged by foreign critics as a miscarriage of justice resulting from race-prejudice. If that simple appreciation rightly describes its origin, it became in its development one of those scandals symptomatic of the unhealthy political condition of France, which on a smaller scale had often occurred under the Third Republic, and which were made the pretext by the malcontents of all parties for gratifying their animosities. That in its later stages it was not a question of race-persecution was seen in the curious phenomenon of journals owned or edited by Jews leading the outcry against the Jewish officer and his defenders. That it was not a mere episode of the rivalry between Republicans and Monarchists, or between the advocates of parliamentarism and of military autocracy, was evident from the fact that the most formidable opponents of Dreyfus, without whose hostility that of the clericals and reactionaries would have been ineffective, were republican politicians. That it was not a phase of the anti-capitalist movement was shown by the zealous adherence of the socialist leaders and journalists to the cause of Dreyfus; indeed, one remarkable result of the affair was its diversion of the socialist party and press for several years from their normal campaign against property. The Dreyfus affair was utilized by the reactionaries against the Republic, by the clericals against the non-Catholics, by the anti-clericals against the Church, by the military party against the parliamentarians, and by the revolutionary socialists against the army. It was also conspicuously utilized by rival republican politicians against one another, and the chaos of political groups was further confused by it.

An apologue to the Dreyfus affair was the trial for treason before the Senate, at the end of 1899, of a number of persons, mostly obscure followers either of M. Drouilhède the poet, who advocated a plebiscitary republic, or of the d’Orléans, the pretender to the constitutional monarchy. On the day of President Faure’s funeral M. Drouilhède had vainly tried to entice General Roget, a zealous adversary of Dreyfus, who was on duty with his troops, to march on the Élysée in order to evict the newly-elected president of the Republic. Other demonstrations against M. Loubet ensued, the most offensive being a concerted assault upon him on the racecourse at Auteuil in June 1899. The subsequent resistance to the police of a band of anti-Semites threatened with arrest, who barricaded themselves in a house in the rue Chabrol, in the centre of Paris, and, with the marked approval of the populace, sustained a siege for several weeks, indicated that the capital was in a condition not far removed from anarchy. M. Drouilhède, indicted at the assizes of the Seine for his misdemeanour on the day of President Faure’s funeral, had been triumphantly
acquitted. It was evident that no jury would convict citizens prosecuted for political offences and the government therefore decided to make the article of the Law of 1875, which allowed the Senate to be constituted a high court for the trial of offences endangering the state. A respectable minority of the Senate, including M. Wallon, the venerable "Father of the Constitution" of 1875, vainly protested that the framers of the law intended to invest the upper legislative chamber with judicial power only for the trial of grave crimes of high treason, and not of petty political disorders which a well-organized government ought to be able to repress with the ordinary machinery of police and justice. The outvoted protest was justified by the proceedings before the High Court, which, undignified and disorderly, displayed both the fatuity of the so-called conspirators and the feebleness of the government which had to cope with them. The trial proved that the libelsitic faction was destitute of its essential factor, a chief to put forward for the headship of the state, and that it was resolved, if it overturned the parliamentary system, not to accept under any conditions the du d'Orléans, the only pretender before the public. It was shown that royalists and plebeianary republicans alike had united in an organization of disorder-the anti-Semitic propaganda which had spread the earliest and most popular of the nationalist movement to protect the French from foreign competition. The evidence adduced before the high court revealed, moreover, the curious fact that certain Jewish royalists had given to the du d'Orléans large sums of money to found anti-Semitic journals as the surest means of popularizing his cause.

The last year of the 19th century, though uneventful for France, was one of political unrest. This, however, did not take the form of ministerial crises, as, for the fourth time since responsible cabinets were introduced in 1873, a whole year, from the 1st of January to the 31st of December, elapsed without a change of ministry. The prime minister, M. Waldeck-Rousseau, though his domestic policy exasperated a large section of the public, including one half of the Progressive group which he had helped to found, displayed qualities of statesmanship always respected in France, but rarely exhibited under the Third Republic. He had proved himself to be what the French call un homme de gouvernement—that is to say, an authoritative advocate of action, in action, in all political emergencies, dealing with the arbitrary machinery of Napoleonism. His alliance with the extreme Left and the admission into his cabinet of socialist deputies, showed that he understood which wing of the Chamber it was best to conciliate in order to keep the government in his hands for an abnormal term. The advent to office of Socialists disquieted the respectable and prosperous commercial classes, which in France take little part in politics, though they had small sympathy with the nationalists, who were the most violent opponents of the Waldeck-Rousseau ministry. The alarm caused by the handing over of important departments of the state to socialist politicians arose upon a danger which is not always understood beyond the borders of France. Socialism in France is a movement appealing to the revolutionary instincts of the French democracy, advocated in vague terms by the members of rival groups or sects. Thus the increasing number of socialist deputies in parliament had produced no legislative results, and their presence in the cabinet was not feared on that account. The fear which their office-holding inspired was due to the immense administrative patronage which a central system of government always involves. French ministers are wont to bestow the places at their disposal on their political friends, so the prospect of administrative posts being filled all over the land by revolutionaries caused some uneasiness. Otherwise the presence of Socialists on the ministerial bench seemed to have no other effect than that of partially muzzling the socialist groups in the Chamber. The opposition to the government was heterogeneous. It included the few Monarchists left in the Chamber, the Nationalists, who resembled the Boulangists of twelve years before, and who had added anti-Semitism to the articles of the revisionist creed, and a number of republicans, chiefly of the old Opportunist group, which had renewed itself under the name of Progressists at the time when M. Waldeck-Rousseau was its most important member in the Senate.

The ablest leaders of this Opposition were all malcontent Republicans; and this fact seemed to show that if ever any form of monarchy were restored in France, political office would probably remain in the hands of men who were former ministers of the Third Republic. Thus the most conspicuous opponents of the cabinet were three ex-prime ministers, MM. Méline, Charles Dupuy and Ribot. Less distinguished Republican "ministres" had their normal appetite for office whetted in 1900 by the international exhibition at Paris. It brought the ministers of the day into unusual prominence, and endowed them with large subsidies voted by parliament for official entertainments. The exhibition was planned on too ambitious a scale to be a financial success. It also called forth the just regrets of those who deplored the tendency of Parisians under the Third Republic to turn their once brilliant city into an international casino. Its most satisfactory feature was the proof it displayed of the industrial inventiveness and the artistic instinct of the French. The political importance of the exhibition was determined by the Chamber, which decided not to permit the foreign dignitaries to witness a ministerial crisis. Few strangers of distinction, however, came to it, and not one sovereign of the great powers visited Paris; but the ministry remained in office, and M. Waldeck-Rousseau had uninterrupted opportunity of showing his governmental ability. The only change in his cabinet took place when General de Galliffet resigned the portfolio of war to General André. The army, as represented by its officers, had shown symptoms of hostility to the ministry in consequence of the pardon of Dreyfus. The new minister of war repulsed such demonstrations with proceedings of the same arbitrary character as those which had called forth criticism in England when used in the Dreyfus affair. In both cases the high-handed policy was regarded either with approval or with indifference by the great majority of the French nation, which ever since the Revolution has shown that its instincts are in favour of authoritative government. The emphatic support given by the radical groups to the autocratic policy of M. Waldeck-Rousseau and his minister, was not surprising to those who have studied the history of the French nation. It has always had a talent for despotism since it first became a political power in the days of the Jacobins, to whose early protection General Bonaparte owed his career. On the other hand liberalism has always been repugnant to the masses, and the only period in which the Liberals governed the country was under the régime of limited suffrage—during the Restoration and the Monarchy of July.

The most important event in France during the last year of the century, not from its political result, but from the lessons it taught, was perhaps the Paris municipal election. The quadrennial renewal of all the municipal councils of France took place in May 1900. The municipality of the capital had been for many years in the hands of the extreme Radicals and the revolutionary Socialists. The Parisian electors now sent to the Hôtel de Ville a council in which the majority were Nationalists, in general sympathy with the anti-Semitic and plebeianary movements. The nationalist councillors did not, however, form one solid party, but were divided into five or six groups, representing every shade of political discontent, from monarchism to revisionist-socialism. While the electorate of Paris thus pronounced for the French constitution, the municipal elections, as far as they had a political bearing, were favourable to the ministry and to the Republic. M. Waldeck-Rousseau accepted the challenge of the capital, and dealt with its representatives with the arbitrary weapons of centralization which the Republic had inherited from the Napoleonic settlement of the Revolution. Municipal autonomy is unknown in France, and the town council of Paris has to submit to special restrictions on its liberty of action. The prefect of the Seine is always present at its meetings as agent of the government and the minister of
the interior can veto any of its resolutions. The Socialists, when
their party ruled the municipality, clamoured in parliament for
the removal of this administrative control. But now
being in a minority they supported the government
in its anti-autonomic rigours. The majority of the
municipal council authorized its president to invite
to a banquet, in honour of the international exhibition,
the provincial mayors and a number of foreign municipal
magistrates, including the lord mayor of London. The ministers
were not invited, and the prefect of the Seine thereupon informed
the president of the municipality that he had no right, without
consulting the agent of the government, to offer a banquet to the
provincial mayors; and they, with the deference which French
officials instinctively show to the central authority, almost all
refused the invitation to the Hôtel de Ville. The municipal
banquet was therefore abandoned, but the government gave
one in the Tuileries gardens, at which no fewer than 22,000 mayors
paid their respects to the chief of the state. These events showed
that, as in the Terror, as at the coup d'etat of 1851, and as in the
insurrection of the Commune, the French provinces were never
disposed to follow the political lead of the capital, whether
the opposition was that of the monarchical or revolutionary.
The incidents displayed the tendency of the French democracy,
like the national, to submit to and even to encourage the
arbitrary working of administrative centralization.
The elected mayors of the provincial communes, urban and rural,
quitted themselves like well-drilled functionaries of the
state, respectful of their hierarchical superiors, just as in the days
when they were the nominees of the government; while the
population of Paris, in spite of its perennial proneness to revolution,
accepted the rebuff inflicted on its chosen representatives
without any hostile demonstration. The municipal elections
in Paris afforded fresh proof of the unchanging political ineptitude of the
reactionaries. The dissatisfaction of the great capital with the government of the Republic might, in spite of the
reductiveness of the provinces to follow the lead of Paris, have had
great results if skillfully organized. But the anti-republican
groups, instead of putting forward men of high ability or reputation
to take possession of the Hôtel de Ville, chose their candidates
among the same inferior class of professional politicians as the
Radicals and the Socialists whom they replaced on the municipal
council.

The beginning of a century of the common era is a purely
artificial division of time. Yet it has often marked a turning-
point in the history of nations. This was notably the
case in France in 1800. The violent and anarchical
phases of the Revolution of 1789 came to an end with
the 18th century; and the dawn of the 19th was
coincident with the administrative reconstruction
of France by Napoleon, on lines which endured with
little modification till the end of that century, surviving seven
revolutions of the executive power. The opening years of the
20th century saw no similar changes in the government of the
country. The Third Republic, which was about to attain an
age double that reached by any other régime since the Revolution,
continued to live on the basis of the Constitution enacted in
1875, before it was five years old. Yet it seems not unlikely that
historians of the future may take the date 1900 as a landmark
between two distinct periods in the evolution of the French
nation.

With the close of the 19th century the Dreyfus affair came
practically to an end. Whatever the political and moral causes
of the agitation which attended it, its practical result
was to strengthen the Radical and Socialist parties in the
Republic, and to reduce to unprecedented impotence
the forces of reaction. This was due more to the
maladroitness of the Reactionaries than to the virtues or the
prescience of the extreme Left, as the imprisonment of the Jewish
captain, which agitated and divided the nation, could not have
been inflicted without the ardent approval of Republicans of
all shades of opinion. But when the majority at last realized
that a mistake had been committed, the Reactionaries, in great
measure through their own unwise policy, got the chief credit
for it. Consequently, as the clericals formed the militant section
of the anti-Republican parties, and as the Radical-Socialists
were at that time keener in their hostility to the Church than in
their zeal for social or economic reform, the issue of the Dreyfus
affair brought about an anti-clerical movement, which, though
initiated and organized by a small minority, met with nothing
to resist it in the country, the reactionary forces being effete
and the vast majority of the population indifferent. The main
and absorbing feature therefore of political life in France in the
first years of the 20th century was a campaign against the Roman
Catholic Church, unparalleled in energy since the Revolution.
Its most striking result was the rupture of the Concordat between
France and the Vatican. This act was additionally important
as being the first considerable breach made in the administrative
structure reared by Napoleon, which had hitherto survived all
the vicissitudes of the 19th century. Concurrently with this
the influence of the Socialist party in French policy largely
increased. A primary principle professed by the Socialists
throughout Europe is pacifism, and its dissemination in France
acted in two very different ways. It encouraged in the French
departments a growth of anti-war sentiment, also some sign
of infecting the national army, and it impelled the government
of the Republic to be zealous in cultivating friendly relations
with other powers. The result of the latter phase of pacifism
was that France, under the Radical-Socialist administrations
of the early years of the 20th century, enjoyed a measure of
international prestige of that superficial kind which is expressed
by the state visits of crowned heads to the chief of the executive
power, greater than at any period since the Second Empire.
The voting of the law which separated the Church from the
state will probably mark a capital date in French history; so
as the ecclesiastical policy of successive ministries
filled almost entirely the interior chronicles of France
for the first five years of the new century, it will be
considered for set forth in order the events which during that
period led up to the passing of the Separation Act.
The French legislature during the first session of the 20th
century was chiefly occupied with the passing of the Associations
Law. That measure, though it entirely changed the legal
situation of all associations primarily directed
against the religious associations of the Roman Church.
Their influence in the land, according to the anti-clericals, had
been proved by the Dreyfus affair to be excessive. The Jesuits
were alleged, on their own showing, to exercise considerable
power over the officers of the army, and in this way to have
been largely responsible for the blunders of the Dreyfus case.
Another less celebrated order, which took an active part against Dreyfus,
the Assumptionists, had achieved notoriety by its journalistic
enterprise, its cheap newspapers of wide circulation being
remarkeable for the violence of their attacks on the institutions
and men of the Republic. The mutual antagonism between
the French government and religious congregations is a tradition
which dates from the ancient monarchy and was continued
by Napoleon I. long before the Third Republic adopted it in
the legislation associated with the names of Jules Ferry and Paul
Bert. The prime minister, under whose administration the
20th century succeeded the 19th, was M. Waldeck-Rousseau,
who had been the colleague of Paul Bert in Gambetta's grand
ministere, and in 1880 had served under Jules Ferry in his
second ministry. He had retired from political life, though he retained
a member of the Senate, and was making a large fortune at the
bar, when in June 1895, at pecuniary sacrifice, he consented to
form a ministry for the purpose of "liquidating" the Dreyfus
affair. In 1900, the year after the second condemnation of
Dreyfus and his immediate pardon by the government, M.
Waldeck-Rousseau in a speech at Toulouse announced that
legislation was about to be undertaken on the subject of associa-
tions.

At that period the hostility of the Republic to the principle
of associations of all kinds, civil as well as religious, was still
enforced by the law. With the exception of certain commercial
societies subject to special legislation, no association composed of more than twenty persons could be formed without governmental authorization which was always revocable, the restriction applying equally to political and social clubs and to religious communities. The law was the same for all, but was differently applied. Authorization was rarely refused to political or social societies, though any club was liable to have its authorization withdrawn and to be shut up or dissolved. But to religious orders new authorization was practically never granted. Only four of them, the orders of Saint Lazare, of the Saint Esprit, of the Missions Étrangères and of Saint Sulpice, were authorized under the Third Republic—their authorization dating from the First Empire and the Restoration. The Frères de la Doctrine Chrétienne were also recognized, not, however, as a religious congregation under the jurisdiction of the minister of public worship, but as a teaching body under that of the minister of education. All the great historical orders, preaching, teaching or contemplative, were "unauthorized"; they led a precarious life on sufferance, having as corporations no civil existence, and being subject to dissolution at a moment's notice by the administrative authority. In spite of this disability and of the decrees of 1889 directed against the Church, the Christian communities on the right of the anti-clerical Republic had continued to flourish. Religious of both sexes were more numerous in France at the beginning of the 20th century than at the end of the ancient monarchy. Moreover, in the twenty years during which unauthorized Orders had been supposed to be suppressed under the Ferry Decrees, their numbers had become six times more numerous than before, while it was the authorized Congregations which had diminished. The bare catalogue of the religious houses in the land, with the value of their properties (estimated by M. Waldeck-Rousseau at a milliard—$400,000,000) filled two White Books of two thousand pages, presented to parliament on the 4th of December 1900. The hostility to the Congregations was not confined to the anti-clericals. The secular clergy were suffering materially from the enterprising competition of their old rivals the regulars. Had the legislation for defining the legal situation of the religious orders been undertaken with the sole intention of limiting their excessive growth, such a measure would have been welcome to the parochial clergy. But they saw that the attack upon the congregations was only preliminary to a general attack upon the Church. The inescapable conclusion of the prime minister, a statesman of conservative temperament, that no harm would accrue to the secular clergy from the passing of the Associations Law.

In January 1901, on the eve of the first debate in the Chamber of Deputies on the Associations bill, a discussion took place which showed that the rupture of the Concordat might be nearing the range of practical politics, though parliament was as yet unwilling to take it into consideration. The archbishop of Paris, Cardinal Richard, had published a letter addressed to him by Leo XIII deploring the projected legislation as being a breach of the Concordat under which the free exercise of the Catholic religion in France was assured. The Socialists argued that this letter was an intolerable intervention on the part of the Vatican in the domestic politics of the Republic, and proposed that parliament should after voting the Associations Law proceed to separate Church and State. M. Waldeck-Rousseau, the prime minister, calm and moderate, declined to take this view of the pope's letter, and the resolution was defeated by a majority of more than two to one. But the question of theadherence to the right of the Nationalists in the Chamber to declare its resolve to maintain the Concordat, was rejected by a small majority. The discussion of the Associations bill was then commenced by the Chamber and went on until the Easter recess. Its main features when finally voted were that the right to associate for purposes not illicit should be henceforth free of all restrictions, though "juridical capacity" would be accorded only to such associations as were formally notified to the administrative authority. The law did not, however, accord liberty of association to religious "Congregations," none of which could be formed without a special statute, and any constituted without such authorization would be deemed illicit. The policy of the measure, as applying to religious orders, was attacked by the extreme Right and the extreme Left from their several standpoints. The clericals proposed that under the new law all associations, religious as well as civil, should be free. The Socialists proposed that all religious communities, authorized or unauthorized, should be suppressed. The prime minister took a middle course. But he went farther than the moderate Republicans, with whom he was generally classed. While he protected the authorized religious orders against the attacks of the extreme anti-clericals, he accepted from the latter a new clause which disqualified any member of an unauthorized order from teaching in any school. This was a blow at the principle of liberty of instruction, which had always been supported by Liberals of the old school, who had no sympathy with the pretensions of clericalism. Consequently this provision, though voted by a large majority, was opposed by the Liberals of the Republican party, notably by M. Ribot, who had been twice prime minister, and M. Aynard, almost the sole survivor of the Left Centre. It was remarked that in these, as in all subsequent debates on ecclesiastical questions, the ablest defenders of the Church were not found among the clericals, but among the periods. The primary doctrine was that of tolerance, which they believed ought in the light of the whole history of Europe to be exercised by the religion nominally professed by a large majority of the nation. Few of the ardent professors of that religion gave effective aid to the Church during that period of crisis. M. de Mun still used his eloquence in its defence, but the brilliant Catholic orator had entered his sixtieth year with health impaired, and among the young reactionary members there was not one who displayed any talent. At the other end of the Chamber M. Viviani, a Socialist member for Paris, made an eloquent speech. As was anticipated the bill received no serious opposition in the Senate. Though not in sympathy with the attacks of the Socialists in the Chamber on property, the Upper House had as a whole no objection to their attacks on the Church, and had become a more persistently anti-clerical body than the Chamber of Deputies. The bill was therefore passed without any serious amendments, even those which were moved for the purpose of affirming the principle of liberty of education being supported by very few Republican senators. In the debates following the utterance of M. Waldeck-Rousseau the prime minister was important. On the proposal of M. Rausch the law, which was a minister of education in the Méline cabinet of 1896, that religious associations should be authorized by decree and not by law, M. Waldeck-Rousseau said that inasmuch as vows of poverty and celibacy were illegal, nothing but a law would suffice to give legality to any association in which such vows were imposed on the members. It was thus laid down by the responsible author of the law that the third clause, providing that any association founded for an illicit cause was null, applied to religious communities. On the other hand the prime minister in another speech repudiated the suggestion that the proposed law was aimed against any form of religion. He argued that the religious orders, far from being essential to the existence of the Church, were a hindrance to the work of the parochial clergy, and that inasmuch as the religious orders were organizations independent of the State they were by their nature and influence a danger to the State. Consequently their regulation had become necessary in the interests both of Church and State. The general suppression of religious congregations, the prime minister said, was not aimed at the parochial clergy, but at the ultra-clericals and the Right, who had not the French sentiment, and he had no doubt that parliament would favourably consider the authorization of those whose aim was to alleviate misery at home or to extend French influence abroad. The tenor of M. Waldeck-Rousseau's speech was eminently Concordatary. One of his chief arguments against the religious orders was that they were not mentioned in the Concordat, and that their unregulated existence prejudiced the interests of the Concordatary clergy. The speech was therefore an official declaration in favour of the maintenance of the relations between Church and State. That being so, it is important to notice that
by a majority of nearly two to one the Senate voted the placarding of the prime minister's speech in all the communes of France, and that the mover of the resolution was M. Combes, senator of the Charente-Inférieure, a politician of advanced views who up to that date had held office only once, when he was minister of education and public worship for about six months, in the Bourgeois administration in 1895-1896.

The "Law relating to the contract of association" was promulgated on the 2nd of July 1901, and its enactment was the only political event of high importance that year.

The Socialists, except in their anti-clerical capacity, were more active outside parliament than within. Early in the year some formidable strikes took place. At Montceau-les-Mines in Burgundy, where labour demonstrations had often been violent, a new feature of a strike was the formation of a trade-union by the non-strikers, who called their organization "the yellow trade-union" (le syndicat jaune) in opposition to the red trade-union of the strikers, who adopted the revolutionary flag and were supported by the Socialist press. At the same time the dock-labourers at Marseilles went out on strike, by the orders of an international trade-union in that port, as a protest against the dismissal of a certain number of foreigners. The number of strikes in France had increased considerably under the Liégois-Rousseau government. Its opponents attributed this to the presence in the cabinet of M. Millerand, who had been ranked as a Socialist. On the other hand, the revolutionary Socialists excommunicated the minister of commerce for having joined a "bourgeois government" and retired from the general congress of the Socialist party at Lyons, where M. Briand and Viviani, themselves future ministers, persuaded the majority not to go so far. The federal committee of miners projected a general strike in all the French coal-fields, and to that end organized a referendum. But of 125,000 miners inscribed on their lists nearly 70,000 abstained from voting, and although the general strike was voted in October by a majority of 34,000, it was not put into effect.

Another movement favoured by the Socialists was that of anti-militarism. M. Hervé, a professor at the lycée of Sens, had written, in a local journal, the Pionnière de l'Yonne, on the occasion of the departure of the conscripts for their regiments, some articles outraging the French flag. He was prosecuted and acquitted at the assizes at Auxerre in November, a number of his colleagues in the teaching profession coming forward to testify that they shared his views. The local educational authority, the academic council of Dijon, however, dismissed M. Hervé from his official functions, and its sentence was confirmed by the superior council of public education to which he had appealed. Thereupon the Socialists in the Chamber, under the lead of M. Viviani, violently attacked the Government shortly before the prorogation at the end of the year. M. Leygues, the minister of education, defended the policy of his department with equal vigour, declaring that if a professor in the "university" claimed the right of publishing unpatriotic and anti-military opinions he could exercise it only on the condition of giving up his employment under government—a thesis which was supported by the entire Chamber with the exception of the Socialists. This manifestation of anti-military spirit, though not widespread, was the more striking as it followed close upon a second visit of the emperor and empress of Russia to France, which took place in September 1901 and was of a military rather than of a popular character. The Russian sovereigns did not come to Paris. After a naval display at Dunkirk, where they landed, they were the guests of President Loubet at Compiègne, and concluded their visit by attending a review near Reims of the troops which had taken part in the Eastern manoeuvres. Compared with the welcome given by the French population to the emperor and empress in 1856 their reception on this occasion was not enthusiastic. By not visiting Paris they seemed to wish to avoid contact with the people, who were persuaded by a section of the press that the motive of the imperial journey to France was financial. The Socialists openly repudiated the Russian alliance, and one of them, the mayor of Lille, who refused to decorate his municipal buildings when the sovereigns visited the department of the Nord, was neither revoked nor suspended, although he publicly based his refusal on grounds insulting to the tsar.

It may be mentioned that the census returns of 1902 showed that the total increase of the population of France since the previous census in 1896 amounted only to 412,364, of which 289,662 was accounted for by the capital, while on the other hand the population of sixty out of eighty-seven departments had diminished.

As the quadrennial election of the Chamber of Deputies was due to take place in the spring of 1902, the first months of that year were chiefly occupied by politicians in preparing for it, though none of them gave any sign of being aware that the legislation to be effected by the new Chamber would be the most important which any parliament had undertaken under the constitution of 1875. At the end of the recess the prime minister in a speech at Saint Etienne, the capital of the Loire, of which department he was senator, passed in review the work of his ministry. With regard to the future, on the eve of the election which was to return the Chamber destined to disestablish the Church, he assured the secular clergy that they must not consider the legislation of the last session as menacing them: far from that, the recent law, directed primarily against those monastic establishments which were anti-Republican associations, owning political journals and organizing electioneering funds (whose members he described as moines ligueurs et moines d'ailleurs), would be a guarantee of the Republic's protection of the parochial clergy. The presence of his colleague, M. Millerand, on this occasion showed that M. Waldeck-Rousseau did not intend to separate himself from the Radical-Socialist group which had supported his government; and the next day the Socialist minister of commerce, at Firminy, a mining centre in the same department, made a speech depreciating the pursuit of unnatural social ideals, which might have been a version of Gambetta's famous discourse on opportunism edited by an economist of the school of Léon Say. The Waldeck-Rousseau programme for the elections seemed therefore to be an implied promise of a moderate opportunism which would strengthen and unite the Republic by conciliating all sections of its supporters. When parliament met, M. Delcassé, minister for foreign affairs, on a proposal to suppress the Embassy to the Vatican, declared that even if the Concordat were ever revoked it would still be necessary for France to maintain diplomatic relations with the Holy See. On the other hand, the ministry voted, against the moderate Republicans, for an abstract resolution, proposed by M. Briçon in favour of the abrogation of the Loi Falloux of 1850, which law, by establishing the monopoly of the "university", had established the principle of liberty of education. Another abstract resolution, supported by the government, which subsequently became law, was voted in favour of the reduction of the terms of compulsory military service from three years to two.

The general elections took place on the 27th of April 1902, with the second ballots on the 11th of May, and were favourable to the ministry, 321 of its avowed supporters being returned and 268 members of the Opposition, including 140 "Progressist" Republicans, many of whom were deputies whose opinions differed little from those of M. Waldeck-Rousseau. In Paris the government lost a few seats which were won by the Nationalist group of reactionaries. The chief surprise of the elections was the announcement made by M. Waldeck-Rousseau on the 20th of May, while the president of the Republic was in Russia on a visit to the tsar, of his intention to resign office. No one but the prime minister's intimates knew that his shattered health was the true cause of his resignation, which was attributed to the unwillingness of an essentially moderate man to be the leader of an advanced party and the instrument of an immediate policy. His retirement from public life at this crisis was the most important event of its kind since the death of his old master Gambetta. He had learned opportunistic statesmanship in the short-lived grand ministère and in the long-lived Ferry administration of 1883-
FRANCE

1885, after which he had become an inactive politician in the Senate, while making a large fortune at the bar. In spite of having espoused politics he had been ranked in the public mind with Gambetta and Jules Ferry as one of the small number of politicians of the Republic who had risen high above mediocrity. While he had none of the magnetic exuberance which furthered the popularity of Gambetta, his cold intransigence had not made him unpopular as was his other chief, Jules Ferry. Indeed, his unemotional coldness was one of the elements of the power with which he dominated parliament; and being regarded by the nation as the strong man whom France is always looking for, he was the first prime minister of the Republic whose name was made a rallying cry at a general election. Yet the country gave him a majority only for it to be handed over to other politicians to use in a manner which he had not contemplated. On the 3rd of June 1902 he formally resigned office, his ministry having lasted for three years, all but a few days, a longer duration than that of any other under the Third Republic.

M. Loubet called upon M. Léon Bourgeois, who had already been prime minister under M. Félix Faure, to form a ministry, but he had been nominated president of the new Chamber. The president of the Republic then offered the post to M. Brisson, who had been twice prime minister in 1885 and 1886 and also refused. A third member of the Radical party was then sent for, M. Emile Combes, and he accepted. The senator of the Charente Inférieure, in his one short term of office in the Bourgeois ministry, had made no mark. But he had attained a minor prominence in the debates of the Senate by his ardent anti-clericalism. He had been educated as a seminarist and had taken minor orders, without proceeding to the priesthood, and had subsequently practised as a country doctor before entering parliament. M. Combes retained two of the most important members of the Waldeck-Rousseau cabinet, M. Delcassé, who had been at the foreign office for four years, and General André, who had become war minister in 1900 on the resignation of General de Gallifet. General André was an ardent Dreyfusard, strongly opposed to clerical and reactionary influences in the army. Among the new ministers was M. Rouvier, a colleague of Gambetta in the grand ministère and prime minister in 1887, whose participation in the Panama affair had caused his retirement from official life. Being a moderate opportunist and reputed the ablest financier among French politicians, his return to the ministry of finance reassured those who feared the fiscal experiments of an administrateur general supported by the Socialists. The nomination as minister of Marine of M. Camille Pelletan (the son of Eugène Pelletan, a notable adversary of the Second Empire), who had been a Radical-Socialist deputy since 1881, though new to office, was less reassuring. M. Combes reserved for himself the departments of the interior and public worship, meaning that the centralized administration of France should be in his own hands while he was keeping watch over the Church. But in spite of the prime minister’s extreme anti-clericalism there was no hint made in his ministerial declaration, on the 10th of June 1902, on taking office that there would be any question of the new Chamber dealing with the Concordat or with the relations of Church and state. M. Combes, however, warned the secular clergy not to make common cause with the religious orders, against which he soon began vigorous action. Before the end of June he directed the Préfets of the departments to bring political pressure to bear on all branches of the public service, and he obtained a presidential decree closing a hundred and twenty-five schools, which had been recently opened in buildings belonging to private individuals, on the ground that they were conducted by members of religious associations and that this brought the schools under the law of 1901. Such action seemed to be opposed to M. Waldeck-Rousseau’s interpretation of the law; but the Chamber, having supported M. Combes he ordered in July the closing of 2,500 schools, conducted by members of religious orders, for which authorization had not been requested. This again seemed contrary to the assurances of M. Waldeck-Rousseau, and it called forth vain protests in the name of liberty from Radicals of the old school, such as M. Goblet, prime minister in 1886, and from Liberal Protestants, such as M. Gabriel Monod. The execution of the decree closing the schools of the religious orders caused some violent agitation in the provinces during the parliamentary recess. But the majority of the departmental councils, at their meetings in August, passed resolutions in favour of the governmental policy, and a movement led by certain Nationalists, including M. Drumont, editor of the anti-Semitic Libre Parole, and M. François Coppée, the Academician, to found a league having similar aims to those of the “passive resisters” in our country, was a complete failure. On the reassembling of parliament, both houses passed votes of confidence in the ministry and also an act supplementary to the Associations Law penalizing the opening of schools by members of religious orders.

In spite of the ardour of parliamentary discussions the French public was less moved in 1902 by the anti-clerical action of the government than by a vulgar case of swindling known as the “Humbert affair.” The wife of a former deputy for Seine-et-Marne, who was the son of M. Gustave Humbert, minister of justice in 1882, had for many years maintained a luxurious establishment, which included a political salon, on the strength of her assertion that she and her family had inherited several millions sterling from one Crawford, an Englishman, who had been killed while on a visit to her. She had married her daughter as a great heiress to a Moderate Republican deputy who held a conspicuous position in the Chamber. The flight of the Humberts, the exposure of the fraud and their arrest in Spain excited the French nation more deeply than the relative qualities of M. Waldeck-Rousseau and M. Combes or the woes of the religious orders. A by-election to the Senate in the spring of 1902 merits notice as it brought back to parliament M. Clémenceau, who had lived in comparative retirement since 1893 when he lost his seat as deputy for Dragaigian, owing to a series of unusually bitter attacks made against him by his political enemies. He had devoted his years of retirement to journalism, taking a leading part in the Dreyfus affair on the side of the accused. His election as senator for the Var, where he had formerly been deputy, was an event of importance unanticipated at the time.

The year 1903 saw in progress a momentous development of the anti-clerical movement in France, though little trace of this is found in the statute-book. The chief act of parliament of that year was one which interested the population more than any other that year, the Law Abolishing the movement Church. This was an act regulating the privileges of the bouilleurs de cru, the peasant proprietors who, permitted to distill from their produce an annual quantity of alcohol supposed to be sufficient for their domestic needs, in practice fabricated and sold so large an amount as to prejudice gravely the inland revenue. As there were a million of these illicit distillers in the land they formed a powerful element in the electorate. The crowded and excited debates affecting their interests, in which Radicals and Royalists of the rural districts made common cause against Socialists and Clericals of the towns, were in striking contrast with the less animated discussions concerning the Church. The prime minister, an anti-clerical zealot, bitterly hostile to the Church of which he had been a minister, took advantage of the relative indifference of parliament and of the nation in matters ecclesiastical. The success of M. Combes in his campaign against the Church was an example of what energy and pertinacity can do. There was no great wave of popular feeling on the question, no mandate given to the deputies at the general election or asked for by them. Neither was M. Combes a popular leader or a man of genius. He was rather a trained politician, with a fixed idea, who knew how to utilize to his ends the ability and organization of the extreme anti-clerical element in the Chamber, and the weakness of the extreme clerical party. The majority of the Chamber did not share the prime minister’s animosity towards the Church, for which at the same time it had not the least enthusiasm, and under the concordatory lead of M. Waldeck-Rousseau it would have been content to
curb clerical pretensions without having recourse to extreme measures of repression. It was, however, equally content to follow the less tolerant guidance of M. Combes. Thus, early in the session of 1903 it approved of his circular forbidding the priests of Brittany to make use of the Breton language in their religious instruction under pain of losing their salaries. It likewise followed him on the 26th of January when he declined to accept, as being premature and unpractical, a Socialist resolution in favour of suppressing the budget of public worship, though the majority was indeed differently composed on those two occasions. In the Senate on the 29th of January M. Waldeck-Rousseau indicated what his policy would have been had he retained office, by severely criticizing his successor's method of applying the Associations Law. Instead of asking parliament to judge on its merits each several demand for authorization made by a congregation, the government had divided the religious orders into two chief categories, teaching orders and preaching orders, and had recommended that all should be suppressed by a general refusal of authorization. The Grande Chartreuse was put into a category by itself as a trading association and was dissolved; but Lourdes, which with its crowds of pilgrims enriched the Pyrenean region and the railway companies serving it, was spared for electioneering reasons. A diploma was passed by the government and the Vatican on the nomination of bishops to vacant sees. The Vatican insisted on the words "nobis nominavit" in the papal bulls instituting the bishops nominated by the chief of the executive in France under the Concordat. M. Combes objected to the pronoun, and maintained that the complete nomination belonged to the French government, the Holy See having no choice in the matter, but only the power of canonical institution. This produced a deadlock, with the consequence that no more bishops were ever again appointed under the Concordat, which both before and after the Easter recess M. Combes now threatened to repudiate. These menaces derived an increased importance from the failing health of the pope. Leo XIII. had attained the great age of ninety-three, and on the choice of his successor grave issues depended. He died on the 20th of July 1903. The conclave indicated as his successor his secretary of state, Cardinal Rampolla, an able exponent of the late pope's diplomatic methods and also a warm friend of France. It was said to be the latter quality which induced Austria to exercise its ancient power of veto on the choice of a conclave, and finally Cardinal Sarto, patriarch of Venice, a pious prelate inexperienced in diplomacy, was elected and took the name of Pius X. In September M. Combes was succeeded by M. Renan at Trèguier, his birthplace, was made the occasion of an anti-clerical demonstration in Catholic and reactionary Brittany, at which the prime minister made a militant speech in the name of the freethinkers of France, though Renan was a Voltairian aristocrat who disliked the aims and methods of modern Radical-Socialists. In the course of his speech M. Combes pointed out that the anti-clerical policy of the government had not caused the Republic to lose prestige in the eyes of the monarchies of Europe, which were then showing it unprecedented attentions. This assertion was true, and had reference to the visit of the king of England to the president of the Republic in May and the projected visit of the king of Italy. That of Edward VII., which was the first state visit of a British sovereign to France for nearly fifty years, was returned by President Loubet in July, and was welcomed by all parties, excepting some of the reactionaries. M. Mllevoye, a Nationalist deputy for Paris, in the Paire counselled the Parisians to remember Fashoda, the Transvaal War, and the attitude of the English in the Dreyfus affair, and to greet the British monarch with cries of "Vivent les Boers." M. Drouléde, the most interesting member of the Nationalist party, wrote from his exile at Saint-Sébastien protesting against the folly of this proceeding, which merits to be put on record as an example of the incorrigible ineptitude of the reactionaries in France. The incident served only to prove their complete lack of influence on popular feeling, while it damaged the cause of the Church at a most critical moment by showing that the only persons in France willing to insult a friendly monarch who was the guest of the nation, belonged to the clerical party. Of the royal visits that of the king of Italy was the more important in its immediate effects on the history of France, as will be seen in the narration of the events of 1904.

The session of 1904 began with the election of a new president of the Chamber, on the retirement of M. Bourgeois. The choice fell on M. Henri Brisson, an old Radical, but not a Socialist, who had held that post in 1881 and had subsequently filled it on ten occasions, the election to the office being annual. The narrow majority he obtained over M. Paul Bertrand, a little-known moderate Republican, by secret ballot, followed by the defeat of M. Jaurès, the Socialist leader, for one of the vice-presidential chairs, showed that one half of the Chamber was of moderate tendency. But, as events proved, the Moderates lacked energy and leadership, so the influence of the Radical prime minister prevailed. In a debate on the 22nd of January on the expulsion of an Alsatian priest of French birth from a French frontier department by the French police, M. Ribot, who set an example of activity to younger men of the moderate groups, reproached M. Combes with reducing all questions in which the French nation was interested to the single one of anti-clericalism, and the prime minister retorted that it was solely for that purpose that he took office. In pursuance of this policy he introduced and passed by a narrow margin the celebrated law, which the Senate passed in the summer, swept out of existence the schools of the Frères de la Doctrine Chrétienne (Christian Brothers) and closed in all 2400 schools before the end of the year.

This drastic act of anti-clerical policy, which was a total repudiation by parliament of the principle of liberty of education, should have warned the authorities of the Church of the relentless attitude of the government. The most superficial observation ought to have shown them that the indifference of the nation would permit the prime minister to go to any length, and common prudence should have prevented them from affording him any pretext for more damaging measures. The President of the Republic accepted an invitation to return the visit of the king of Italy. When it was submitted to the Chamber on March 29th, 1904, a reactionary deputy moved the rejection of the vote for the expenses of the journey on the ground that the chief of the French executive ought not to visit the representative of the dynasty which plundered the papal State. The amend- ment was supported by a majority of 492 votes to 12, which showed that at a time of bitter controversy on ecclesiastical questions French opinion was unanimous in approving the visit of the president of the Republic to Rome as the guest of the king of Italy. Nothing could be more gratifying to the entire French nation, both on racial and on traditional grounds, than such a testimony of a complete revival of friendship with Italy, of late years obscured by the Triple Alliance. Yet the Holy See saw fit to advance pretensions inevitably certain to serve the ends of the extreme anti-clericals, whose most intolerant acts at that moment, such as the removal of the crucifixes from the law-courts, were followed by new electoral successes. Thus the reactionary majority on the Paris municipal council was displaced by the Radical-Socialists on the 1st of May, the day that M. Loubet returned from his visit to Rome. On the 16th of May M. Jaurès' Socialist organ, L'Humanité, published the text of a protest, addressed by the pope to the powers having diplomatic relations with the Vatican, against the visit of the president of the Republic to the King of Italy. This document, dated the 28th of April, was offensive in tone both to France and to Italy. It intimated that while Catholic sovereigns refrained from visiting the person who, contrary to right, exercised civil sovereignty in Rome, that "duty" was even more "imperious" for the ruler of France by reason of the "privileges" enjoyed by that country from the Concordat; that the journey of M. Loubet to "pay homage" within the pontifical see to that person was an insult to the sovereign pontiff; and that only for reasons of special gravity was the nuncio permitted to remain
in Paris. The publication of this document caused some joy among the extreme clericals, but this was nothing to the exultation of the anti-clericals, who saw that the papal diplomacy of Leo XIII, which had risen superior to many a provocation of the French government, was succeeded by a papal policy which would facilitate their designs in a manner unlooked for. Moderate men were dismayed, seeing that the Concordat was now in instant danger; but the majority of the French nation remained entirely indifferent to its fate. Within a week France took the initiative by recalling the ambassador to the Vatican, M. Nisard, leaving a third-secretary in charge. In the debate in the Chamber upon the incident, the foreign minister, M. Delcassé, said that the ambassador was recalled, not because the Vatican had protested against the visit of the president to the king of Italy, but because it had communicated this protest, in terms offensive to France, to foreign powers. The Chamber on the 27th of May approved the recall of the ambassador by the large majority of 420 to 90. By a much smaller majority it rejected a Socialist motion that the Nuncio should be given his passports. The action of the Holy See was not actually an infringement of the Concordat. The government, satisfied with the effect public opinion was now prepared for a rupture with the Vatican, was willing to wait for a new pretext, which was not long in coming. Two bishops, Mgr. Geay of Laval and Mgr. Le Nordez of Dijon, were on bad terms with the clerical reactionaries in their dioceses. The friends of the prelates, including some of their episcopal brethren, thought that their chief offence was their loyalty to the Republic, and it was an unfortunate coincidence that these bishops, subjected to proceedings which had been unknown under the pontificate of Leo XIII, should have been two who had incurred the animosity of anti-republicans. Their enemies accused Mgr. Geay of immorality and Mgr. Le Nordez of being in league with the freemasons. The bishop of Laval was summoned by the Holy Office, without any communication with the French government, to resign his see, and he submitted the citation forthwith to the minister of public worship. The French chargé d'affaires at the Vatican was instructed to protest against this grave infringement of an article of the Concordat, and, soon after, against another article, demanding that the concordat commissioners had written the lines ordering him to suspend his ordinances, the Nuncio being limited, like all other ambassadors, to communicating the instructions of his government through the intermediary of the minister for foreign affairs. The Vatican declined to give any satisfaction to the French government and summoned the two bishops to Rome under pain of suspension. So the French chargé d'affaires was directed to leave Rome, after having informed the Holy See that the government of the Republic considered that the mission of the apostolic Nuncio in Paris was terminated. Thus came to an end on the 30th of July 1904 the diplomatic relations which under the Concordat had subsisted between France and the Vatican for more than a hundred years.

Twelve days later M. Waldeck-Rousseau died, having lived just long enough to see this unanticipated result of his policy. It was said that his resolve to regulate the religious associations arose from his feeling that whatever injustice had been committed in the Dreyfus case had been aggravated by the action of certain unauthorized orders. However that may be, his own utterances showed that his bitter violation of the policy was only finality. But he had not reckoned that his last days, which needed hands as calm and impartial as his own to apply it, would be used in a manner he had not contemplated by sectarian politicians who would be further aided by the self-destructive policy of the highest authorities of the Church. When parliament assembled for the autumn session a general feeling was expressed, by moderate politicians as well as by supporters of the Combes ministry, that disestablishment was inevitable. The prime minister said that he had been long in favour of it, though the previous year he had intimated to M. Nisard, ambassador to the Vatican, that he had not a majority in parliament to vote it. But the papacy and the clergy had since done everything to change that situation. The Chamber did not move in the matter beyond appointing a committee to consider the general question, to which M. Combes submitted in his own name a bill for the separation of the churches from the State.

During the last three months of 1904 public opinion was diverted to the cognate question of the existence of masonic adoration in the army. M. Guyot de Villeneuve, Nationalist deputy for Saint Denis, who had been dismissed from the army by General de Gallifet in connexion with the Dreyfus affair, brought before the Chamber a collection of documents which, it seemed, had been abstracted from the Grand Orient of France, the headquarters of French freemasonry, by an official of that order. These papers showed that an elaborate system of espionage and delation had been organized by the freemasons throughout France for the purpose of obtaining information as to the political opinions and religious practices of the officers of the army, and that this system was worked with the connivance of certain officials of the ministry of war. Its aim appeared to be to ascertain if officers went to mass or sent their children to convent schools and to report their names to the minister of war. The sympathy with the Roman Catholic religion, the names of officers suspected or blacklisted were placed on a black-list at the War Office, whereby they were disqualified for promotion. There was no doubt about the authenticity of the documents or of the facts which they revealed. Radical ex-ministers joined with moderate Republicans and reactionaries in denouncing the system. Anti-clerical deputies declared that it was no use to cleanse the war office of the influence of the Jesuits, which was alleged to have prevailed there, if it were to be replaced by another occult power, more demoralizing because more widespread. Only the Socialists and a few of the Radical-Socialists in the Chamber supported the action of the freemasons. General André, minister of war, was so clearly implicated, with the evident approval of the prime minister, that a revulsion of feeling against the policy of the anti-clerical cabinet began to operate in the Chamber. Had the opposition been wisely guided there can be little doubt that a moderate ministry would have been called to office and the history of the Church in France might have been changed. But the reactionaries, with their accustomed folly, played into the hands of their adversaries. The League of the Black-Shirt, which André had founded, delivered a speech which produced a bad impression. As he stepped down to leave the platform he was struck in the face by a Nationalist deputy for Paris, a much younger man than he. The cowardly assault did not save the minister, who was too deeply compromised in the delationscandal. But it saved the anti-clerical party, by rallying a number of waveringers who, until this exhibition of reactionary policy, were prepared to go over to the Moderates, from the "bloc," as the ministerial majority was called. The Nationalist deputy was committed to the assises on the technical charge of assaulting a functionary while performing his official duties. Towards the end of the year, on the eve of his trial, he met with a violent death, and the circumstances which led to it, when made public, showed that this champion of the Church was a man of low morality. General André had previously resigned and was succeeded as minister of war by M. Berteaux, a wealthy stock-broker and a Socialist.

The Combes cabinet could not survive the delation scandal, in spite of the resignation of the minister of war and the ineptitude of the opposition. On the 8th of January a week before the parliament met, an election took place in Paris to fill the vacancy caused by the death of the Nationalist deputy who had assailed General André. The circumstances of his death, at that time partially revealed, did not deter the electors from choosing by a large majority a representative of the same party, Admiral Bienaimé, who the previous year had been removed for political reasons from the post of maritime prefect at Toulon, by M. Camille Pelletan, minister of marine. A more serious check to the Combes ministry was given by the refusal of the Chamber to re-elect as president M. Brisson, who was defeated by a majority of twenty-
five by M. Doumer, ex-Governor-General of Indo-China, who, though he had entered politics as a Radical, was now supported by the anti-republican reactionaries as well as by the moderate Republicans. A violent debate arose on the question of expelling from the Legion of Honour certain members of that order, including a general officer, who had been involved in the delation scandal. M. Jaurès, the eloquent Socialist deputy for Albi, who played the part of Eminence grise to M. Combes in his anti-clerical campaign, observed that the party which was now demanding the purification of the order had been in no hurry to expel from it Esterhazy long after his crimes had been proved in connexion with the Dreyfus case. The debate was inconclusive, and the government on the 14th of January obtained a vote of confidence by a majority of six. But M. Combes, whose animosity towards the church was keener than his love of office, saw that his ministry would be constantly liable to be put in a minority, and that thus the consideration of separation might be postponed until after the general elections of 1906. So he announced his resignation in an unprecedented manifesto addressed to the president of the Republic on the 18th January.

M. Rouvier, minister of finance in the outgoing government, was called upon for the second time in his career to form a ministry. A moderate opportunist himself, he intended to form a coalition cabinet in which all groups of Republicans, from the Centre to the extreme Left, would be represented. But he failed, and the ministry of the 24th of January 1905 contained no members of the Republican opposition which had combatted M. Combes. The prime minister retained the portfolio of finance; M. Delcassé remained at the foreign office, which he had directed since 1898, and M. Berthelot at the war office; M. Etienne, member for Oran, went to the ministry of the interior; another Algerian deputy, M. Thomson, succeeded M. Camille Pelletan at the ministry of marine, which department was said to have taken in its inefficiency; public worship was separated from the department of the interior and joined with that of education under M. Bienvenu-Martín, Radical-Socialist deputy for Auzerre, who was new to official life. Although M. Rouvier, as befitted a politician of the school of Waldeck-Rousseau, disliked the separation of the churches from the state, he accepted that policy as inevitable. After the action of the Vatican in 1904, which had produced the rupture of diplomatic relations with France, many moderates who had been persistent in their opposition to the Combes ministry, and even certain Nationals, accepted the principle of separation, but urged that it should be effected on liberal terms. So on the 27th of January, after the minister of education and public worship had announced that the government intended to introduce a separation bill, a vote of confidence was obtained by a majority of 373 to 99, half of the majority being opponents of the Combes ministry of various Republican and reactionary groups, while the majority was composed of 84 Radicals and Socialists and only 15 reactionaries.

On the 21st of March the debates on the separation of the churches from the state began. A commission had been appointed in 1904 to examine the subject. Its reporter was M. Aristide Briand, Socialist member for Saint Etienne. According to French parliamentary procedure, the reporter of a commission, directed to draw up a great scheme of legislation, can make himself a more important person in conducting it through a house of legislature than the minister in charge of the bill. This is what M. Briand succeeded in doing. He produced with rapidity a "report" on the whole question, in which he traced with superfluous haste the history of the Church in France from the baptism of Clovis, and upon this drafted a bill which was accepted by the government. He thus at one bound came from obscurity into the front rank of politicians, and in devising a revolution he has inferred a lesson of moderate statesmanship. In conducting the debates he took the line of throwing the responsibility for the rupture of the Concordat on the pope. The leadership of the Opposition fell on M. Ribot, who had been twice prime minister of the Republic and was not a practising Catholic. He recognized that separation had become inevitable, but argued that it could be accomplished as a permanent act only in concert with the Holy See. The clerical party in the Chamber did little in defence of the Church. The abbés Lemire and Gayraud, the only ecclesiastics in parliament, spoke with moderation, and M. Groussau, a Catholic jurist, attacked the measure with less temperate zeal; but the best serious defence of the interests of the Church came from the Republican centre. Few amendments from the extreme Left were accepted by M. Briand, whose general tone was moderate and not illiberal. One feature of the debates was the reluctance of the prime minister to take part in them, even when financial clauses were discussed in which his own office was particularly concerned. The bill finally passed the Chamber on the 3rd of July by 347 votes against 233, the majority containing a certain number of conservative Republicans and Nationalists. At the end the Radical-Socialists manifested considerable discontent at the liberal tendencies of M. Briand, and declared that the measure as it left the Chamber to them deserved only partial provisional. In the Senate it underwent no amendment whatever, not a single word being altered. The prime minister, M. Rouvier, never once opened his lips during the lengthy debates, in the course of which M. Clémenceau, as a philosophical Radical who voted for the bill, criticized it as too concordatory, while M. Méline, as a moderate Republican, who voted against it, predicted that it would create such a state of things as would necessitate new negotiations with Rome a few years later. It was finally passed by a majority of 181 to 102, the complete number of senators being 300, and three days later, on the 9th of December 1905, it was promulgated as law by the president of the Republic.

The main features of the act were as follows. The first clauses guaranteed liberty of conscience and the free practice of public worship, and declared that henceforth the Republic neither recognized nor remunerated any form of religion, except in the case of chaplains to public schools, hospitals and prisons. It provided that after inventories had been taken of the real and personal property in the hands of religious bodies, hitherto remunerated by the state, to ascertain whether such property belonged to the state, the department, or the commune, all such property should be transferred to associations of public worship (associations cultuelles) established in each commune in accordance with the rules of the religion which they represented, for the purpose of carrying on the practices of that religion. As the Vatican subsequently refused to permit Catholics to take part in these associations, the important clauses relating to their organization and powers became a dead letter, except in the case of the Protestant and Jewish associations, which affected only a minute proportion of the religious establishments under the act. Nothing, therefore, need be said about them except that the chief discussions in the Chamber took place with regard to their constitution, which was declared to be in accordance with the extreme anti-clericals, that many moderate critics of the original bill thought that thereby the regular practice of the Catholic religion, under episcopal control, had been safeguarded. A system of pensions for ministers of religion hitherto paid by the state was provided, according to the age and the length of service of the ecclesiastics interested, while in small communities of under a thousand inhabitants the clergy were to receive in any case their full pay for eight years. The bishops' palaces were to be let gratuitously at the disposal of the occupiers for two years, and the presbyteries and seminaries for five years. This provision too became a dead letter, owing to the orders given by the Holy See to the clergy. Other provisions enacted that the churches should not be used for political meetings, while the services held in them were protected by the law from the acts of disturbers. As the plenary operation of the law depended on the associations cultuelles, the subsequent failure to create those bodies makes it useless to give a complete exposition of a statute of which they were an essential feature.

The passing of the Separation Law was the chief act of the last year of the presidency of M. Loubet. One other important measure has to be noted, the law reducing compulsory military
service to two years. The law of 1889 had provided a general service of three years, with an extensive system of dispensations accorded to persons for domestic reasons, or because they belonged to certain categories of students, such citizens being let off with one year's service with the colours or being entirely exempted. The new law exacted two years' service from every Frenchman, no one being exempted save for physical incapacity. Under the act of 1905 even the cadets of the military college of Saint Cyr and of the Polytechnic had to serve in the ranks before entering those schools. Anti-military doctrines continued to be encouraged by the Socialist party, M. Hervé, the professor who had been revoked in 1901 for his suggestion of a military strike in case of war and for other unpatriotic utterances, being elected a member of the administrative committee of the Unified Socialist party, of which M. Jaurès was one of the chiefs. At a congress of elementary schoolmasters at Lille in August, anti-military resolutions were passed and a general adhesion was given to the doctrines of M. Hervé. At Longwy, in the Eastern coal-field, a strike took place in September, during which the military was called out to keep order and a workman was killed in a cavalry charge. The minister of war, M. Berthelot, visited the scene of the disturbance, and was reported to have saluted the soldiers with the question: "What is the matter with you?" was borne by a procession of strikers singing the "Internationale."

During the autumn session in November M. Berthelot suddenly resigned the portfolio of war during a sitting of the Chamber, and was succeeded by M. Etienne, minister of the interior, a moderate politician who inspired greater confidence. Earlier in the year other industrial strikes of great gravity had taken place, notably at Limoges, among the potters, where several deaths took place in a conflict with the troops and a factory was burnt. Even more serious were the strikes in the government arsenals in November. At Cherbourg and Brest only a small proportion of the workmen went out, but at Lorient, Rochefort and especially at Toulon the strikes were on a much larger scale. In 1905 solemn warnings were given in the Chamber of the coming crisis in the wine-growing regions of the South. Radical-Socialists such as M. Doumergue, the deputy for Nîmes and a member of the Combes ministry, joined with monarchists such as M. Lassiés, deputy of the Gers, in calling attention to the distress of the populations dependent on the vine. They attributed the distress of these South of France provinces to the alleged over-production, but because of the competition of artificial wines; that formerly only twenty departments of France were classed in the atlas as wine-producing, but that thanks to the progress of chemistry seventy departments were now so described. The deputies of the north of France and of Paris, irrespective of party, opposed these arguments, and the government, while promising to punish fraud, did not seem to take very seriously the legitimate warnings of the representatives of the South.

The Republic continued to extend its friendly relations with foreign powers, and the end of M. Loubet's term of office was signalized by a procession of royal visits to Paris, some of which the president returned. At the end of May the king of Spain came and narrowly escaped assassination from a bomb which was thrown at him by a Spaniard as he was returning with the president from the opera. In October M. Loubet returned this visit at Madrid and went on to Lisbon to see the king of Portugal, being received by the queen, who was the daughter of the count of Flanders and the sister of the duc d'Orléans, both exiled by the Republic. In November the king of Portugal came to Paris, and the president of the Republic also received during the year less formal visits from the kings of England and of Greece.

One untoward international event affecting the French ministry occurred in June 1905. M. Delcassé (see section on Exterior Policy), who had been foreign minister longer than any holder of that office under the Republic, resigned, and it was believed that he had been sacrificed by the prime minister to the exigencies of Germany, which power was said to be disinherited at his having, in connexion with the Morocco question, isolated Germany by promoting the friendly relations of France with England, Spain and Italy. Whether it be true or not that the French government was really in alarm at the possibility of a declaration of war by Germany, the impression given was unfavourable, nor was it removed when M. Rousier himself took the portfolio of foreign affairs.

The year 1906 is remarkable in the history of the Third Republic in that it witnessed the renewal of all the public powers in the state. A new president of the Republic was elected on the 17th of January ten days after the triennial election of one third of the senate, and the general election of the chamber of deputies followed in May—the ninth which had taken place under the constitution of 1875. The senatorial elections of the 7th of January showed that the delegates of the people who chose the members of the upper house and represented the average opinion of the country approved of the anti-clerical legislation of parliament. The election of M. Fallières, president of the senate, to the presidency of the Republic was therefore anticipated, he being the candidate of the parliamentary majorities which had disestablished the church. At the congress of the two chambers held at Versailles on the 13th of May to elect a new president of the republic, M. Fallières was returned by an overwhelming majority of 449 votes out of 849 recorded. The candidate of the opposition was M. Paul Doumer, whose anti-clericalism in the past was so extreme that when married he had dispensed with a religious ceremony and his children were unbaptized. So the curious spectacle was presented of the Moderate Opportunist M. Fallières being elected by Radicals and Socialists, while the Radical candidate was supported by Moderates and Reactionaries. For the second time a president of the senate, the second official personage in the Republic, was advanced to the chief magistracy, M. Loubet having been similarly promoted. As in his case, M. Fallières owed his election to M. Clémenceau. When M. Loubet was elected M. Clémenceau had not come to the end of his retirement from parliamentary life; but in political circles, with his powerful pen and otherwise, he was resuming his former influence as a "king-maker." He knew of the precariousness of Félix Faure's health and of the indiscretions of the elderly president. So when the presidency suddenly became vacant in January 1899 he had already fixed his choice upon M. Fallières as secretary of state, and the name excited no jealousy among the republicans. At that moment falling to the crisis caused by the Dreyfus affair, the Republic needed a safe man to protect it against the attacks of the plebiscitary party which had been latterly favoured by President Faure. M. Constans, it was said, had in 1899 desired the presidency of the senate, vacant by M. Loubet's promotion, in preference to the post of ambassador at Constantinople. But M. Clémenceau, deeming that his name had been too much associated with polemics in the past, contrived the election of M. Fallières to the second place of dignity in the Republic, so as to have another safe candidate in readiness for the Elysée in case President Loubet suddenly disappeared. M. Loubet, however, completed his seventeenth, and to the end of it M. Fallières was regarded as his probable successor. As he fulfilled his high duties in the senate inoffensively without making enemies among his political friends, he escaped the fate which had awaited other presidents-designate of the Republic. Previously to presiding over the senate this Gascon advocate, who had represented his native Lot-et-Garonne, in either chamber, since 1876, had been vice-president for three weeks in 1883. He had also held office in six other ministries, so no politician in France had a larger experience in administration and in public affairs.

On New Year's Day 1906, the absence of the Nuncio from the presidential reception of the diplomatic body marked conspicuously the rupture of the Concordat; for hitherto the representative of the Holy See had ranked as doyen of the ambassadors to the Republic, whatever the relative seniority of his colleagues, and in the name of all the foreign powers had officially saluted the chief of the state. On the 20th of January the inventories of the churches were commenced, under the 3rd clause of the
FRANCE

The Sarrien ministry.

M. Clémenceau minister of the interior.

The Separation Act, for the purpose of assessing the value of the furniture and other objects which they contained. In Paris they occasioned some disturbance; but as the protesting rioters were led by persons whose hostility to the Republic was more notorious than their love for religion, the demonstrations were regarded as political rather than religious. In certain rural districts, where the church had retained its influence and where its separation from the state was unpopular, the taking of the inventories was impeded by the inhabitants, and in some places, where the troops were called out to protect the civil authorities, further feeling was aroused by the refusal of officers to act.

But, as a rule, this first manifest operation of the Separation Law was received with indifference by the population. One region where popular feeling was displayed in favour of the church was Flanders, where, in March, at Boeschepe on the Belgian frontier, a man was killed during the taking of an inventory. This accident caused the fall of the ministry. The moderate Republicans in the Chamber, who had helped to keep M. Rouvier in office, withdrew their support in a debate arising out of the incident, and the government was defeated by thirty-three votes. M. Rouvier resigned, and the new president of the Republic for M. Sarrien, a Radical of the old school from Burgundy, who had been deputy for his native Saône-et-Loire from the foundation of the Chamber in 1876 and had previously held office in four cabinets. In M. Sarrien's ministry of the 14th of March 1906 the president of the council was only a minor personage, its real conductor being M. Clémenceau, who accepted the portfolio of the interior. Upon himself, therefore, devolved the function of "making the elections" of 1906, as it was the minister at the Place Beauvau, where all the wires of administrative government are centralized, who gives the orders to the prefectures at each general election. As in France ministers sit and speak in both houses of parliament, M. Clémenceau, though a senator, was invested with a considerable amount of power, as the Chamber of Deputies, in which he had played a mighty part in the first seventeen years of its existence. His political experience was unique. From an early period after entering the Chamber in 1876 he had exercised there an influence not exceeded by any deputy. Yet it was not until 1906, thirty years after his first election to parliament, that he held office—though in 1888 he had missed the presidency of the Chamber, receiving the same number of votes as M. Méline, to whom the post was allotted by right of seniority. He now returned to the tribune of the Palais Bourbon, on which he had been a most formidable orator. During his career as deputy his eloquence was chiefly destructive, and of the nineteen ministries which fell between the election of M. Grévy to the presidency of the Republic in 1879 and his own departure from parliamentary life in 1893 there were few of which the fall had not been expedited by his morbid criticism or denunciation. He now came back to the scene of his former achievements not to attack but to defend a ministry. Though his old occupation was gone, his re-entry excited the keenest interest, for at sixty-five he remained the biggest political figure in France.

After M. Clémenceau the most interesting of the new ministers was M. Briand, who was not nine years old when M. Clémenceau had become conspicuous in political life as the mayor of Montmartre on the eve of the Commune. M. Briand had entered the Chamber, as Socialist deputy for Saint Etienne, only in 1902. The mark he had made as "reporter" of the Separation Bill has been noted, and on that account he became minister of education and public worship—the terms of the Separation Law necessitating the continuation of a department for ecclesiastical affairs. As he had been a militant Socialist of the "united" group of which M. Jaures was the chief, and also a member of the superior council of labour, his appointment indicated that the new ministry courted the support of the extreme Left. It, however, contained some moderate men, notably M. Pointcaré, who had the repute of making the largest income at the French bar after M. Waldeck-Rousseau gave up his practice, and who became for the second time minister of finance. The portfolios of the colonies and of public works were also given to old ministers of moderate tendencies, M. Georges Leygues and M. Barthou. A former prime minister, M. Léon Bourgeois, went to the foreign office, over which he had already presided, besides having represented France at the peace conference at the Hague; while MM. Étienne and Thomson retained their portfolios of war and marine. The cabinet contained so many men of tried ability that it was called the ministry of all the talents. But the few who understood the origin of the name knew that it would be even more ephemeral than was the British ministry of 1866; for the fine show of names belonged to a transient combination which could not survive the approaching elections long enough to leave any mark in politics.

Before the elections took place grave labour troubles showed that social and economical questions were more likely to give anxiety to the government than any public movement resulting from the disestablishment of the church. Almost the first ministerial act of M. Clémenceau was to visit the coal basin of the Pas de Calais, where an accident causing great loss of life was followed by an uprising of the working population of the region, which spread into the adjacent department of the Nord and caused the minister of the interior to take unusual precautions to prevent violent demonstrations in Paris on Labour Day, the 1st of May. The activity of the Socialist leaders in encouraging anti-capitalist agitation did not seem to alarm the electorate. Nor did it show any sympathy with the appeal of the pope, who, in his encyclical letter, Venementer nos, addressed to the French cardinals on the 11th of February, denounced the Separation Law. So the result of the elections of May 1906 was a decisive victory for the anticlericals and Socialists.

A brief analysis of the composition of the Chamber of Deputies is always impossible, the limits of the numerous groups being ill-defined. But in general terms the majority supporting the radical policy of the bloc in the last parliament, which had numbered some 500, now numbered more than 400, including 230 Radical-Socialists and Socialists. The gains of the extreme Left were chiefly at the expense of the moderate or progressive republicans, who, about 120 strong in the old Chamber, now came back little more than half that number. The antirepublican Right, comprising Royalists, Bonapartists and Nationalists, had maintained their former position and were about 130 all told. The general result of the polls of the 6th and 20th of May was thus an electoral vindication of the advanced policy adopted by the old Chamber and a repudiation of moderate Republicanism; while the stationary condition of the reactionary groups showed that the tribulations inflicted by the last parliament on the church had not provoked the electorate to increase its support of clerical politicians.

The Vatican, however, declined to recognize this unmistakable demonstration. The bishops, taking advantage of their release from the concordatory restrictions which had withheld from them the faculty of meeting in assembly, had met at a preliminary conference to consider their plan of action under the Separation Law. They had adjourned for further instructions from the Holy See, which were published on the 10th of August 1906, in a new encyclical Gravissimo offici, wherein, to the consternation of many members of the episcopate, the pope interdicted the associations cultuelles, the bodies which, under the Separation Law, were to be established in each parish, to hold and to organize the church property and finances, and were essential to the working of the act. On the 4th of September the bishops met again and passed a resolution of submission to the Holy See. In spite of their loyalty they could not but deplore an injunction which inevitably would cause distress to the large majority of the clergy after the act came into operation on the 12th of December 1906. They knew only too well how hopeless was the idea that the distress of the clergy would call forth any revival of popular feeling in France. The excitement of the public that summer over a painful clerical scandal in the diocese of Chartres showed that the interest taken by the mass of the population in church matters was not of a kind which would aid the clergy in their difficult situation.
In another direction the increased activity in the rural districts of the Socialists, who hitherto had chiefly worked in the industrial centres, indicated that they looked for support from the peasant proprietors, whose ownership in the soil had hitherto opposed them to the practice of collectivist doctrine. In the summer of 1907 an economic crisis in the wine-growing districts of the South created a general discontent which spread to other rural regions. The Clémenceau ministry, while opposing the excesses of revolutionary socialism and while incurring the strenuous hostility of M. Jaurès, the Socialist leader, adopted a programme which was more socialist than that of any previous government of the republic. Under its direction a bill for the imposition of a graduated income tax was passed by the lower house, involving a scheme of direct taxation which would transform the interior fiscal system of France. But the income tax was still only a project of law when M. Clémenceau unexpectedly fell in July 1909, being succeeded as prime minister by his colleague M. Briand. His ministry had, however, passed one important measure which individualists regarded as an act of state-socialism. It took a long step towards the nationalization of railways by purchasing the important Western line and adding it to the relatively small system of state railways. Previously a more generally criticized act of the representatives of the people was not of a nature to augment the popularity of parliaments. But in the midst of an economic crisis, when ministers and deputies increased their own annual salary, or indemnity as it is officially called, to 15,000 francs.

**EXTERIOR POLICY 1870-1909**

The Franco-German War marks a turning-point in the history of the exterior policy of France as distinct as does the fall of the ancient monarchy or the end of the Napoleonic epoch. With the disappearance of the Second Empire, by its own fault, on the field of Sedan in September 1870, followed in the early months of 1871 by the proclamation of the German empire at Versailles and the annexation of Alsace and Lorraine under the treaty of peace of Frankfort, France descended from its primacy among the nations of continental Europe, which it had gradually acquired in the half-century subsequent to Waterloo. It was the design of Bismarck that united Germany, which had been finally established under his direction by the war of 1870, should take the place hitherto occupied by France in Europe. The situation of France in 1871 in no wise resembled that after the French defeat of 1815, when the First Empire, issue of the Revolution, had been upset by a coalition of the continental monarchies which, brought back and supported on his restored throne the legitimate heir to the French crown. In 1871 the Republic was founded in isolation. France was without allies, and outside its frontiers the form of its executive government was a matter of interest only to its German conquerors. Bismarck desired that France should remain isolated in Europe and divided at home. He thought that the Republican form of government would best serve these ends. The revolutionary tradition of France would, under a Republic, keep aloof the monarchies of Europe, whereas, in the words of the German ambassador at Paris, Prince Hohenlohe, a “monarchy would strengthen France and place her in a better position to make alliances and would threaten our alliances.” At the same time Bismarck counted on governmental instability under a Republic to bring about domestic disorganization which would so disintegrate the French nation as to render it unformidable as a foe and ineffective as an ally. The Franco-German War thus produced a situation unprecedented in the mutual relations of two great European powers. From that situation resulted all the exterior policy of France, for a whole generation, colonial as well as foreign.

In 1875 Germany, in possession of a constitution which gave promise of durability if not of permanence, German opinion had already been perturbed by the facility and speed with which France had paid off the colossal war indemnity exacted by the conqueror, thus giving proof of the inexhaustible resources of the country and of its powers of recuperation. The
successful reorganization of the French army under the military law of 1872 caused further alarm. When it appeared that a move was possible to the withdrawal of Russia from the Triple Alliance, which had set the seal on Germany's triumph and France's abasement in Europe. It seemed, therefore, that it might be expedient for Germany to make a sudden aggression upon France before that country was adequately prepared for war, in order to crush the nation irreparably and to remove it from among the great powers of Europe.

The constitution of the Third Republic was voted by the National Assembly on the 25th of February 1875. The new constitution had to be completed by electoral laws and other complementary provisions, so it could not become effective until the following year, after the first elections of the newly founded Senate and Chamber of Deputies. M. Buffet was then charged by the president of the republic, Marshal MacMahon, to form a provisional ministry in which the duc Decazes, who had been foreign minister since 1873, was retained at the Quai d'Orsay. The cabinet met for the first time on the 11th of March, and ten days later the National Assembly adjourned for a long recess.

It was during that interval that occurred the incident known as "The Scare of 1875." The Kulturkampf had left Prince Bismarck in a state of nervous irritation. In all directions he was on the look out for traces of Ultramontane intrigue. The clericals in France after the fall of Thiers had behaved with great indiscretion in their desire to see the temporal power of the pope revived. But when the reactionaries had placed MacMahon at the head of the state, their divisions and their political ineptitude had shown that the government of France would soon pass from their hands, and of this the voting of the Republican constitution by a monarchical assembly was the visible proof. Nevertheless Bismarck, influenced by the presence at Berlin of a French ambassador, M. de Gontaut-Biron, whom he regarded as an Ultramontane agent, seems to have thought otherwise. A military party at Berlin affected alarm at a war passed by the French Assembly on the 12th of March, which continued a provision increasing from three to four the battalions of each infantry regiment, and certain journals, supposed to be inspired by Bismarck, argued that as the French were preparing, it might be well to anticipate their designs before they were ready. Eure, the emperor William, gave a personal assurance in The Times, professing to reveal the designs of Bismarck, from its Paris correspondent, Blowitz, who was in relations with the French foreign minister, the duc Decazes, and with Prince Hohenlohe, German ambassador to France, both being prudent diplomats, and, though Catholics, opposed to Ultramontane pretensions. Europe was astounded at the revelation and alarmed at the alleged imminence of war. In England the Disraeli ministry addressed the governments of Russia, Austria, and Italy, with a view to restraining Germany from its aggressive designs, and Queen Victoria wrote to the German emperor to plead the cause of peace. It is probable that there was no need either for this intervention or for the panic which had produced it. We know now that the old emperor William was steadfastly opposed to a fresh war, while his son, the crown prince Frederick, who then seemed likely soon to succeed him for a long reign, was also determined that peace should be maintained. The scare had, however, a most important result, in sowing the seeds of the subsequent Franco-Russian alliance. Notwithstanding that the tsar Alexander II. was on terms of affectionate intimacy with the prince of the Rhine, the emperor William gave a personal assurance in to General Le Flé, French ambassador at St. Petersburg, that France should have the "moral support" of Russia in the case of an aggression on the part of Germany. It is possible that the danger of war was exaggerated by the French foreign minister and his ambassador at Berlin, as is the opinion of certain French historians, who think that M. de Gontaut-Biron, as an old royalist, was only too glad to see the Republic under the protection, as it were, of the most reactionary monarchy of Europe. At the same time Bismarck's denials of having acted with terrorizing intent cannot be accepted. He was more sincere when he criticized the ostentation with which the Russian Chancellor, Prince Gorchakov, had claimed for his master the character of the defender of France and the obstacle to German ambitions. It was in memory of this that, in 1878 at the congress of Berlin, Bismarck did his best to impair the advantages which Russia had obtained under the treaty of San Stefano.

The events which led to that congress put into abeyance the prospect of a serious understanding between France and Russia. The insurrection in Herzegovina in July 1875 reopened the Eastern question, and in the Orient the interests of France and Russia had been for many years conflicting, as witness the controversy concerning the Holy Places, which was one of the causes of the Crimean War. France had from the reign of Louis XIV. claimed the exclusive right of protecting Roman Catholic interests in the East. This claim was supported not only by the monarchists, for the most part friendly to Russia in other respects, who directed the foreign policy of the Third Republic until the Russo-Turkish War of 1877, but by the Republicans, who were coming into perpetual power at the time of the congress of Berlin—the ablest of the anti-Russian in the war, declaring that Germany's "anti-clericalism was not an article of exposition." The defeat of the monarchists at the elections of 1877, after the "Seize Mai," and the departure from office of the duc Decazes, whose policy had tended to prepare the way for an alliance with the tsar, changed the attitude of French diplomacy towards Russia. M. Waddington, the first Republican minister for foreign affairs, was not a Russophile, while Gambetta was ardently anti-Russian, and he, though not a minister, was exercising that preponderant influence in French politics which he retained until 1882, the last year of his life. Many Republicans considered that the monarchists, whom they had turned out, favoured the support of Russia not only as a defence against Germany, which was not likely to be effective so long as a friendly uncle and nephew were reigning at Berlin and at St. Petersburg respectively, but also as a possible means of facilitating a monarchical restoration in France. Consequently at the congress of Berlin M. Waddington and the other French delegates maintained a very independent attitude towards Russia. They supported the resolutions which aimed at diminishing the advantages obtained by Russia in the war, obtaining the withdrawal of the French troops over the Holy Places, and they opposed the anti-Semitic views of the Russian representatives. The result of the congress of Berlin seemed therefore to draw France and Russia farther apart, especially as Gambetta and the Republicans now in power were more disposed towards an understanding with England. The contrary, however, happened. The victory of Berlin, which took the place of the treaty of San Stefano, was the ruin of Russian hopes. It was attributed to the support given by Bismarck to the anti-Russian policy of England and Austria at the congress, the German chancellor having previously discouraged the project of an alliance between Russia and Germany. The consequence was that the tsar withdrew from the Dreikaiserbund, and Germany, finding the support of Austria inadequate for its purposes, sought an understanding with Italy. Hence arose the Triple Alliance of 1882, which was the work of Bismarck, who thus became eventually the author of the Franco-Russian alliance, which was rather a sedative for the nervous temperament of the French than a remedy necessary for their protection. The twofold aim of the Triplex was the development of the Bismarckian policy of the continued isolation of France and of the maintenance of the situation in Europe acquired by the German empire in 1871. The most obvious alliance for Germany was that with Russia, but it was clear that it could be obtained only at the price of Russia having a free hand to satisfy its ambitions in the East. This not only would have irritated England against Germany, but also Austria, and so might have brought about a Franco-Austrian alliance, and a day of reckoning for Germany for the combined rancours of two nations, left by 1866 and 1871. It was thus that Germany allied itself first
with Austria and then with Italy, leaving Russia eventually to unite with France.

As the congress of Berlin took in review the general situation of the Turkish empire, it was natural that the French delegates should formulate the position of France in Egypt.

Thus the powers of Europe accepted the maintenance of the condominium in Egypt, financial and administrative, of England and France. Egypt, nominally a province of the Turkish empire, had been invested with a large degree of autonomy, guaranteed by an agreement made in 1840 and 1841 between the Porte and the then five great powers, though some opposition was made to France being a party to this compact. By degrees Austria, Prussia and Russia (as well as Italy when it attained the rank of a great power) had left the international control of Egypt to France and England by reason of the preponderance of the interests of those two powers on the Nile.

In 1875 the interests of England in Egypt, which had hitherto been considered inferior to those of France, gained a superiority owing to the purchase by the British government of the shares of the khedive Ismail in the Suez Canal. Whatever rivalry there may have been between England and France, they had to present a united front to the pretensions of Ismail, whose prodigalities made him impatient of the control which they exercised over his finances. Gambetta, who had declared himself a republic, was re-established by his successor Tewfik on the 4th of September 1879. The revival ensued of a so-called national party, which Ismail for his own purposes had encouraged in its movement hostile to foreign domination. In September 1881 took place the rising led by Arabi, by whose action an assembly of notables was convoked for the purpose of deposing the government authorized by the European powers. The fear lest the sultan should intervene gave an appearance of harmony to the policy of England and France, whose interests were too great to permit of any such interference. At the end of 1879 the first Freycinet cabinet had succeeded that of M. Waddington and had in turn been succeeded in September 1880 by the first Ferry cabinet. In the latter the foreign minister was M. Barthélémy-Saint-Hilaire, an aged philosopher who had had almost taken part in politics when he helped to dethrone Charles X. in 1830. In September 1881 he categorically invited the British government to join France in a military intervention to oppose any interference which the Porte might attempt, and the two powers each sent a war-ship to Alexandria. On the 14th of November Gambetta formed his grand ministère, in which he was foreign minister. Though it lasted less than eleven weeks, important measures were taken by it, as Arabi had become under-secretary for war at Cairo, and was receiving secret encouragement from the sultan. On the 7th of January 1882, at the instance of Gambetta, a joint note was presented by the British and French consuls to the khedive, to the effect that their governments were resolved to maintain the status quo, Gambetta having designed this as a consecration of the Anglo-French alliance in the East. Thereupon the Porte protested, by a circular addressed to the powers, against this infringement of its suzerainty in Egypt. Meanwhile, the assembly of notables claimed the right of voting the taxes and administering the finances of the country, and Gambetta, considering this as an attempt to emancipate Egypt from the financial control of Europe, moved the British government to join with France in protesting against any interference on the part of the notables in the budget. But when Lord Granville accepted this proposal Gambetta had fallen, on the 26th of January, being succeeded by M. de Freycinet, who for the second time took office as French minister for foreign affairs. Gambetta fell nominally on a scheme of partial revision of the constitution. It included the re-establishment of scrutin de liste, a method of voting to which many Republicans were hostile, so this gave his enemies in his own party their opportunity. He thus fell the victim of republican jealousy, nearly half the Republicans in the chamber voting against him in the fatal division. The subsequent debates of 1882 show that many of Gambetta's adversaries were also opposed to his policy of uniting with England on the Egyptian question. Henceforth the interior affairs of Egypt have little to do with the subject we are treating; but some of the incidents in France which led to the English occupation of Egypt ought to be mentioned. M. de Freycinet was opposed to any armed intervention by France; but in the face of the feeling in the country in favour of maintaining the traditional influence of France in Egypt, his declarations of policy were vague. On the 23rd of February 1882 he said that he would assure the non-exclusive preponderance in Egypt of France and England by means of an understanding with Europe, and on the 11th of May that he wished to retain for France its peculiar position of privileged influence. England and France sent to Alexandria a combined squadron, which did not prevent a massacre of Europeans there on the 11th of June, the khedive being now in the hands of the military party under Arabi. On the 12th of July the English fleet bombarded Alexandria, the French ships in anticipation of that action having departed the previous day. On the 18th of July the Chamber debated the supplementary vote for the fleet in the Mediterranean, M. de Freycinet declaring that France would take no active part in Egypt except as the mandatory of the European powers. This was the occasion for the last great speech of Gambetta in parliament. In it he earnestly urged close co-operation with England, which he predicted would otherwise become the mistress of the country, and whose policy he reproached with the famous "Ne romps jamais l'alliance anglaise." A further vote proposed in consequence of Arabi's open rebellion, was abandoned, as M. de Freycinet announced that the European powers declined to give France and England a collective mandate to intervene in their name. In the Senate on the 25th of July M. Scherer, better known as a philosopher than as a politician, who had Gambetta's confidence, read a report on the supplementary votes which severely criticized the timidity and vacillation of the government in Egyptian policy. Four days later in the Chamber M. de Freycinet proposed an understanding with England limited to the protection of the Suez Canal. Attacked by M. Clémenceau on the impossibility of separating the question of the canal from the general Egyptian question, the ministry was defeated by a huge majority, and M. de Freycinet fell, having achieved the distinction of being the chief instrument in removing Egypt from the sphere of French interest.

Some of the Republicans whose votes turned out M. de Freycinet wanted Jules Ferry to take his place, as he was considered more cautious in foreign affairs. An attempt was made by France; for this reason, was willing to see his personal enemy at the head of Republican affairs. But this was prevented by M. Clémenceau and the extreme Left, and the new ministry was formed by M. Duclerc, an old senator whose previous official experience had been under the Second Republic. On its taking office on the 7th of August, the ministerial declaration announced that its policy would be in conformity with the vote which, by refusing supplies for the occupation of the Suez Canal, had overthrown M. de Freycinet. The declaration characterized this vote as "a measure of reserve and of prudence but not as an abdication." Nevertheless the action of the Chamber—which was due to the hostility to Gambetta of rival leaders, who had little mutual affection, including MM. de Freycinet, Jules Ferry, Clémenceau and the president of the Republic, M. Grévy, rather than to a desire to abandon Egypt—did result in the abdication of France. After England single-handed had subdued the rebellion and restored the authority of the khedive, the latter signed a decree on the 11th of January 1883 abolishing the joint control of England and France. Henceforth Egypt continued to be a frequent topic in the Chamber, as the interests of France, the protection of the Egyptian finances, the judicial system and other institutions formed the subject of diplomatic correspondence, as did the irritating question of the eventual evacuation of Egypt by England. But though it caused constant friction between the two countries up to the Anglo-French convention of the 8th of April 1904, there was no longer a French active policy with regard to Egypt. The lost predominance of France in that country did, however, quicken French activity in other regions of northern Africa.
The idea that the Mediterranean might become a French lake has, in different senses, been a preoccupation for France and for its rivals in Europe ever since Algeria became a French province by a series of fortuitous incidents—an insult offered by the dey to a French consul, his refusal to make reparation, and the occasion it afforded of diverting public attention in France from interior affairs after the Revolution of 1830. The French policy of preponderance in Egypt had only for a secondary aim the domination of the Mediterranean. The French tradition in Egypt was a relic of Napoleon's vain scheme to become emperor of the Orient even before he had made himself emperor of the West. It was because Egypt was the highway to India that under Napoleon III. the French had constructed the Suez Canal, and for the same reason England could never permit them to become masters of the Nile delta. But the possessors of Algeria could extend their coast-line of North Africa without seriously menacing the power which held Gibraltar and Malta. It was Italy which objected to a French occupation of Tunis. Algeria has never been officially a French "colony." It is in many respects administered as an integral portion of French territory, the governor-general, as agent of the central power, exercising wide jurisdiction. Although the Egyptians in Algiers have never been subjected to conscription, and although the French are actually a minority of the European inhabitants—Spaniards prevailing in the west, Italians and Maltese in the east—the three departments of Constantine, Algiers and Oran are administered like three French departments. Consequently, when disturbances occurred on the borderland separating Constantine from Tunis, the French were able to say to Europe that the integrity of their national frontier was threatened by the proximity of a turbulent neighbour. The history of the relations between Tunis and France were set forth, from the French standpoint, in a circular, in which Jules Ferry was said to be the author, addressed to the foreign minister, M. Barthélemy Saint-Hilaire on the 9th of May 1881, to the diplomatic agents of France abroad. The most important point emphasized by the French minister was the independence of Tunis from the Porte, a situation which would obviate difficulties with Turkey such as had always hampered the European powers in Egypt. In support of this contention a protest made by the British government in 1830, which was turned aside by the government of Algiers, was in 1868 quoted, as in it Lord Aberdeen had declared that Europe had always treated the Barbary states as independent powers. On the other hand, there was the incident of the bey of Tunis having furnished to Turkey a contingent during the Crimean War, which suggested a recognition of its vassalage to the Sublime Porte. But in 1864, when the sultan had sent a fleet to La Goulette to affirm his "rights" in Tunis, the French ambassador at Constantinople intimated that France declined to have Turkey for a neighbour in Algeria. France also in 1868 essayed to obtain control over the finances of the regency; but England and Italy had also large interests in the country, so an international financial commission was appointed. In 1871, when France was disabled after the war, the bey obtained from Constantinople a firman of investiture, thus recognizing the suzerainty of the Porte. Certain English writers have reproached the Foreign Office for its lack of foresight in not taking advantage of France's discomfiture by establishing England as the preponderant power in Tunis. The fact that five-sixths of the commerce of Tunis is now with France and Algeria may seem to justify this remark. Yet by the light of subsequent events it seems probable that England would have been diverted from more profitable undertakings had she been saddled with the virtual administration and military occupation of a vast territory which such preponderance would have entailed. The wonder is that this opportunity was not seized by Italy; for Mazzini and other workers in the cause of Italian unity, before the Bourbons had been driven from Naples, had cast eyes on Tunis, lying over against the coasts of Sicily at a distance of barely 100 m., as a favourable field for colonization and as the key of the African Mediterranean. But when Rome became once more the capital of Italy, Carthage was not fated to fall again under its domination and the occasion offered by France's temporary impotence was neglected. In 1875 when France was rapidly recovering, there went to Tunis as consul an able Frenchman, M. Roussin, who became virtual ruler of the regency in spite of the resistance of the representatives of Italy. French action was facilitated by the attitude of England. On the 26th of July 1878 M. Waddington wrote to the marquis d'Harcourt, French ambassador in London, that at the congress of Berlin Lord Salisbury had said to him—the two delegates being the foreign ministers of their respective governments—in reply to his protest, on behalf of France, against the proposed English occupation of Cyprus, "Do you think you can do in Tunis: England will offer no opposition." This was confirmed by Lord Salisbury in a despatch to Lord Lyons, British ambassador in Paris, on the 8th of August, and it was followed in October by an intimation made by the French ambassador at Rome that France intended to exercise a preponderant influence in Tunis. Italy was not willing to accept this situation. In January 1881 a tour made by King Humbert in Sicily, where he received a Tunisian mission, was taken to signify that Italy had not done with Tunis, and it was answered in April by a French expedition in the regency sent from Algeria, on the pretext of punishing the Kroumias who had been murdering on the frontier of Constantine. It was on this occasion that M. Barthélemy Saint-Hilaire issued the circular quoted above. France nominally was never at war with Tunis; yet the result of the invasion was that that country became virtually a French possession, although officially it is only under the protection of France. The treaty of El Bardo of the 12th of May 1881, confirmed by the decree of the 22nd of April 1882, placed Tunis under the protectorate of France. The country is administered under the direction of the French Foreign Office, in which there is a department of Tunisian affairs. The governor is called minister resident-general of France, and he also acts as foreign minister, being assisted by seven French and two native ministers.

The annexation of Tunis was important for many reasons. It was the first successful achievement of France after the disasters of the Franco-German War, and it was the first enterprise of serious utility to France undertaken beyond its frontiers since the early period of the Second Empire. It was also important in establishing the hegemony of France on the southern shores of the Mediterranean. When M. Jules Cambon became governor-general of Algeria, his brother M. Paul Cambon having been previously French resident in Tunis and remaining the vigilant ambassador to a Mediterranean power, a Parisian wit said that just as Switzerland had its Lac des quatre Cantons, so France had made of the midland sea its Lac des deux Cambons. The jeu d'esprit indicated what was the primary significance to the French of their becoming masters of the Barbary coast from the boundary of Morocco to that of Tripoli. Apart from the Mediterranean question, when the scramble for Africa began and the Hinterland doctrine was asserted by European powers, the possession of this extended coast-line resulted in France laying claim to the Sahara and the western Sudan. Consequently, on the maps, the whole of northwest Africa, from Tunis to the Congo, is claimed by France with the exception of the relatively small areas on the coast belonging to Morocco, Spain, Portugal, Liberia, Germany and England. On this vast basis, in point of area, France is the greatest African power, in spite of British annexations in southern and equatorial Africa, its area being estimated at 3,866,950 sq. m. (including 227,950 in Madagascar) as against 2,101,411 more effectively possessed by Great Britain. The immensity of its domain on paper is no doubt a satisfaction to a people which prefers to pursue its policy of colonial expansion without the aid of emigration. The acquisition of Tunis by France is also important as an example of the system of protectorate as applied to colonization. Open annexation might have more gravely irritated the powers having interests in the country. England, in spite of Lord Salisbury's suggestions to the French foreign minister, was none too pleased with France's policy; while Italy, with its subjects outnumbering all other European settlers in the
regency, was in a mood to accept a pretext for a quarrel for the reasons already mentioned. Apart from these considerations the French government favoured a protectorate because it did not wish to make of Tunis a second Algeria. While the annexation of the latter had excellent commercial results for France, it had not been followed by successful colonization, though it had cost France 160 millions sterling in the first sixty years after it became French territory. The French cannot govern at home or abroad without a centralized system of administration. The organization of Algeria, as departments of France with their administrative divisions, was not an example to imitate. In the beylical government France found, ready-made, a sufficiently centralized system, such as did not exist in Algeria under native rule, which could form a basis of administration by French functionaries under the direction of the Quai d’Orsay. The result has not been unpleasing to the numerous advocates in France of protectorates as a means of colonization. According to M. Paul Leroy-Beaulieu, the most eminent French authority on colonization, who knows Tunis well, a protectorate is the most pacific, the most successful, the least costly, the least disinterested, the most easy way of conducting in countries where an organized form of native government exists; it is the system in which the French can most nearly approach that of English crown colonies. One evil which it avoids is the so-called representative system, under which senators and deputies are sent to the French parliament not only from Algeria as an integral part of France, but from the colonies of Martinique, Guadeloupe and French India, while Cochinchina, Guiana and Senegal send deputies alone. These sixteen deputies and seven senators attach themselves to the various Moderate, Radical and Socialist groups in parliament, which have no connexion with the interests of the colonies; and the consequent introduction of French political controversies into colonial elections has not been of advantage to the overseas possessions of France. From this the protectorate system has spared Tunis, and the paucity of French immigration will continue to safeguard that country from parliamentary representation. After twenty years of French rule, of 120,000 European residents in Tunis, not counting the army, only 20,000 were French, while nearly 70,000 were Italian. If under a so-called representative system the Italians had demanded nationalization, for the purpose of obtaining the franchise, complications might have arisen which are not to be feared under a protectorate.

But of all the results of the French annexation of Tunis, the most important was undoubtedly the Triple Alliance, into which Italy entered in resentment at having been deprived of the African territory which seemed marked out as ‘its natural field for colonial expansion. The most manifest cause of Italian hostility towards France had passed away four years before the annexation of Tunis, when the reactionaries, who had favoured the restitution of the temporal power of the pope, fell for ever from power. The clericalism of the anti-republicans, who favoured a revival of the fatal policy of the Second Empire whereby France, after Magenta and Solferino, had by leaving its garrison at St. Angelo, been the last obstacle to Italian unity, was one of the chief causes of their downfall. For after the war with Germany, the mutilated land and the vanquished nation had need to avoid wanton provocations of foreign powers. Henceforth the French Republic, governed by Republicans, was to be an anti-clerical force in Europe, sympathizing with the Italian occupation of Rome. But to make Italy realize that France was no longer the enemy of complete Italian unity it would have been necessary that all causes of irritation between the two Latin sister nations were removed. Such causes of dissension did, however, remain, arising from economic questions. The maritime relations of the two chief Mediterranean powers were based on a treaty of navigation of 1862—when Venice was no party to it being an Austrian port—which Crispin denounced as a relic of Italian servility towards Napoleon III. Commercial rivalry was induced by the industrial development of northern Italy, when freed from Austrian rule. Moreover, the emigrant propensity of the Italians flooded certain regions of France with Italian cheap labour, with the natural result of bitter animosity between the intruders and the inhabitants of the districts thus invaded. The annexation of Tunis, coming on the top of these causes of irritation, exasperated Italy. A new treaty of commerce was nevertheless signed between the two countries on the 3rd of November 1881. Unfortunately for its stability, King Humbert the previous week had gone to Vienna to see the emperor of Austria. In visiting in his capital the former arch-enemy of Italian unity, who could never return the courtesy, Rome being interdicted for Catholic sovereigns by the ‘prisoner of the Vatican,’ Humbert had only followed the example of his father Victor Emmanuel, who went both to Berlin and to Vienna in 1873. But that was when in France the duc de Broglie was prime minister of a clerical government of which many of the supporters were clamouring for the restitution of the temporal power. King Humbert’s visit to Vienna at the moment when Gambetta, the great anti-clerical champion, was at the height of his influence was significant for other reasons. Since the 7th of October 1879 Germany and Austria had been united by a defensive treaty, and though the provisions were not published until 1888, the two central empires were known to be in the closest alliance. The king of Italy’s visit to Vienna, where he was accompanied by his ministers Depretis and Mancini, had therefore the same significance as though he had gone to Berlin also. On the 20th of May 1882 was signed the treaty of the Triple Alliance, which for many years bound Italy to Germany in its relations with the continental powers. The alliance was first publicly announced on the 13th of March 1883, in the Italian Chamber, by Signor Mancini, minister for foreign affairs. The aim of Italy in joining the combination was alliance with Germany, the enemy of France. The connexion with Austria was only tolerated because it secured a union with the powerful government of Berlin. It effected the complete isolation of France in Europe. An understanding between the French Republic and Russia, which alone could alter that situation, was impracticable, as its only basis seemed to be the possibility of having a common enemy in Germany or even in England. But the possible eventuality was anticipated by a secret rumour. When concluded at Skiernewice in September 1884 by the tsar and the German emperor, in which they guaranteed to one another a benevolent neutrality in case of hostilities between England and Russia arising out of the Afghan question. It will be convenient here to refer to the relations of France with Germany and Italy respectively in the years succeeding the signature of the Triple Alliance. With Germany both Gambetta, who died ten weeks before the treaty was announced and who was a strong Russophobe, and his adversary Jules Ferry were inclined to come to an understanding. But in this they had not the support of French opinion. In September 1883 the king of Spain had visited the sovereigns of Austria and Germany. Alphonso XII., to prove that this journey was not a sign of hostility to France, came to Paris on his way home on Michaelmas Day on an official visit to President Grévy. Unfortunately it was announced that the German emperor had made the king colonel of the regiments of the German 3rd Uhlans. At Strassburg, the anniversary of the taking of which city was being celebrated by the emperor by the inauguration of a monument made out of cannon taken from the French, on the very eve of King Alphonso’s arrival. Violent protests were made in Paris in the monarchical and in not a few republican journals, with the result that the king of Spain was hooted by the crowd as he drove with the president from the station to his embassy, and again on his way to dine the same night at the Elysée. The incident was closed by M. Grévy’s apologies and by the retirement of the minister of war, General Thibaudin, who under pressure from the extreme Left had declined to meet le roi uhlans. Though it displayed the bitter hostility of the population towards Germany, the incident did not aggravate Franco-German relations. This was due to the policy of the prime minister, Jules Ferry, who to carry it out made himself foreign minister in November, in the place of Challelem-Lacour, who resigned.
Jules Ferry's idea was that colonial expansion was the surest means for France to recover its prestige, and that this could be obtained only by maintaining peaceful relations with all the powers of Europe. His consequent unpopularity caused his fall in April 1885, and the next year a violent change of military policy was marked by the arrival of General Boulanger at the ministry of war, where he remained, in the Freycinet and Goblet cabinets, from January 1886 to the 17th of May 1887. His growing popularity in France was answered by Bismarck, who asked for an increased vote for the German army, indicating that he considered Boulanger the coming dictator for the war of revenge; so when the Reichstag, on the 14th of January 1887, voted the supplies for three years, instead of for the seven demanded by the chancellor, it was dissolved. Bismarck redoubled his efforts in the press and in diplomacy, vainly attempting to come to an understanding with Russia and with more success moving the Vatican to order the German Catholics to support him. He obtained his vote for seven years in March, and the same month renewed the Triple Alliance. In April the Schnaebelé incident seemed near the eruption of war between France and Germany. Themissary-special, an agent of the ministry of the interior, at Pagny-sur-Moselle, the last French station on the frontier of the annexed territory of Lorraine, having stepped across the boundary to regulate some official matter with the corresponding functionary on the German side, was arrested. It was said that Schnaebelé was arrested actually on French soil, and on whichever side of the line he was standing he had gone to meet the German official at the request of the latter. Bismarck justified the outrage in a speech in the Prussian Landtag which suggested that it was impossible to live at peace with a nation so bellicose as the French. In France the incident was regarded as a trap laid by the chancellor to excite French opinion under the aggressive guidance of Boulanger, and to produce events which would precipitate a war. The French remained calm, in spite of the growing popularity of Boulanger. The Goblet ministry resigned on the 17th of May 1887 after a hostile division on the budget, and the opportunity was taken to get rid of the minister of war, who posed as the coming restorer of Alsace and Lorraine to France. The Boulangerist movement soon became anti-Republican, and the opposition to it of successive ministries improved the official relations of the French and German governments. The circumstances attending the fall of President Grévy the same year strengthened the Boulangerist agitation, and Jules Ferry, who seemed indicated as his successor, was discarded by the Republican majority in the electoral congress, as a revolution was threatened in Paris if the choice fell on "the German Ferry." Sadi Carnot was consequently elected president of the Republic on the 3rd of December 1887. Three months later, on the 9th of March 1888, died the old emperor William who had personified the conquest of France by Germany. His son, the pacific emperor Frederick, died too, on the 13th of June, so the accession of William II., the pupil of Bismarck, at a moment when Boulanger threatened to become plebiscitary dictator of France, was ominous for the peace of Europe. Bismarck, ignominiously fled the country, and in March 1889 Bismarck fell. France none the less rejected all friendly overtures made by the young emperor. In February 1891 his mother came to Paris and was luckily induced to visit the scenes of German triumph near the capital—the ruins of St Cloud and the Château of Versailles where the German empire was proclaimed. The incident called forth such an explosion of wrath from the French press that it was clear that France had not forgotten 1871. By this time, however, France was no longer isolated and at the mercy of Germany, which by reason of the increase of its population while that of France had remained almost stationary, was, under the system of compulsory military service in the two countries, more than a match for its neighbour in a single-handed conflict. Even the Triple Alliance ceased to be a terror for France. An understanding arose between France and Russia preliminary to the Franco-Russian alliance, which became the pivot of French exterior relations until the defeat of Russia in the Japanese war of 1904. So the second renewal of the Tripplice was forthwith answered by a visit of the French squadron to Kronstadt in July 1891.

While such were the relations between France and the principal party to the Triple Alliance, the same period was marked by bitter dissension between France and Italy. Turkey had made Italy Gallophobe, but the diplomatic relations between the two countries had been courteous until the death of Depretis in 1887. When Crispi succeeded him as prime minister, and till 1891 he was the director of the exterior policy of Italy, a change took place. Crispi, though not the author of the Triple Alliance, entered with enthusiasm into its spirit of hostility to France. The old Sicilian revolutionary hastened to pay his respects to Bismarck at Friedrichshruh in October 1887, the visit being highly approved in Italy. Before that the French Chamber had, in July 1886, by a small majority, rejected a new treaty of navigation between France and Italy, this being followed by the failure to renew the commercial treaty of 1881. Irritating incidents were of constant occurrence. In 1886 a conflict between the French consuls in Massowah and Italians who occupied that Abyssinian port induced Bismarck to summon the German ambassador in Paris to tell M. Goblet, minister for foreign affairs in the Floquet cabinet, in case he should refer to the matter, that if Italy were involved thereby in complications it would not stand alone—this menace being communicated to Crispi by the Italian ambassador at Berlin and officially printed in a green-book.

But after Bismarck's fall relations improved a little, and in April 1890 the Italian fleet was sent to Toulon to salute President Carnot in the name of King Humbert, though this did not prevent the French government being suspected of having designs on Tripoli. Italian opinion was again incensed against France by the action of the French clericals, represented by a band of Catholic "pilgrims" who went to Rome to offer their sympathy to the pope in the autumn of 1891, and outraged the burial-place of Victor Emmanuel by writing in the visitors' register kept at the Pantheon the words "Vive le pape!" In August 1893 a flight took place at Aigues Mortes, the medieval walled city near the salt marshes of the Gulf of Lyons, between French and Italian workmen, in which seven Italians were killed. But Crispi had gone out of office early in 1891, and the ministers who succeeded him were more disposed to prevent a rupture between Italy and France. Crispi became prime minister again in December 1893, but this time without the portfolio of foreign affairs. He placed at the Consulta Baron Blanc, who though a strong partisan of the Triple Alliance was closely attached to France, being a native of Savoy, where he spent his yearly vacations on French soil. That the relations between the two nations were better was shown by what occurred after the murder of President Carnot in June 1894. The fact that the assassin was an Italian might have caused trouble a little earlier; but the grief of the Italians was so sincere, as shown by popular demonstrations at Rome, that no anti-Italian violence took place in France, and in the words of the French ambassador, M. Billot, Caserio's crime seemed likely to further an understanding between the two peoples. The movement was very slight and made no progress during the short presidency of M. Casimir-Périer. On the 1st of November 1894, Alexander III. died, when the Italian press gave proof of the importance attributed by the Tripplice to the Franco-Russian understanding by expressing a hope that the new tsar would put an end to it. But on the 10th of June 1895, the foreign minister, M. Hanotaux, intimated to the French Chamber that the understanding had become an alliance, and on the 17th the Russian ambassador in Paris conveyed to M. Félix Faure, who was now president of the Republic, the collar of St Andrew, while the same day the French and Russian men-of-war, invited to the opening of the Kiel Canal, entered German waters together. The union of France with Russia was no doubt one cause of the cessation of Italian hostility to France; but others were at work. The inauguration of the statue of MacMahon at Magenta the same week as the announcement of the Franco-Russian alliance showed that
there was a disposition to revive the old sentiment of fraternity which had once united France with Italy. More important was the necessity felt by the Italians of improved commercial relations with France. Crispi fell on the 4th of March 1896, after the news of the disaster to the Italian troops at Adowa, the war with Abyssinia being a disastrous legacy left by him. The previous year he had caused the withdrawal from Paris of the Italian ambassador Signor Ressmann, a friend of France, transferring tither Count Tornielli, who during his mission in London had made a speech, after the visit of the Italian fleet to Toulon, which qualified him to rank as a misgallato. But with the final disappearance of Crispi the relations of the two Latin neighbours became more natural. Commerce between them had diminished, and the business men of both countries, excepting certain protectionists, felt that the commercial rupture was mutually prejudicial. Friendly negotiations were initiated on both sides, and almost the last act of President Félix Faure before his sudden death—M. Delcassé being then foreign minister—was to promulgate, on the 2nd of February 1899, a new commercial arrangement between France and Italy which the French parliament had adopted. By that time M. Barrère was ambassador at the Quirinal and was engaged in promoting cordial relations between Italy and France, of which Count Tornielli in Paris had already become a chief instrument. Italy remained a plank to the Italian party, which was renewed for a third time in 1899. But so changed had its significance become that in October 1903 the French Republic received for the first time an official visit from the sovereigns of Italy. This reconciliation of France and Italy was destined to have most important results outside the sphere of the Triple Alliance. The return visit which President Loubet paid to Victor Emmanuel III. in April 1904, it being the first time that a French chief of the state had gone to Rome since the pope had lost the temporal sovereignty, provoked a protest from the Vatican which caused the rupture of diplomatic relations between France and the Holy See, followed by the repudiation of the Concordat by an act passed in France, in 1905, separating the church from the state.

While the decedence of the Triple Alliance had this important effect on the domestic affairs of France, its inception had produced the Franco-Russian alliance, which took France out of its isolation in Europe, and became the pivot of its exterior policy. It has been noted that in the years succeeding the Franco-Prussian War the tsar Alexander II. had shown a disposition to support France against German aggression, as though to make up for his treatment during the war, which was a blow to Germany that his uncle William II. had ascribed to it a large share of the German victory. The assassination of Alexander II. by revolutionaries in 1881 made it difficult for the new autocrat to cultivate closer relations with a Russian government, although the Third Republic, under the influence of Gambetta, to whom its consolidation was chiefly due, had repudiated that proselytizing spirit, inherited from the great Revolution, which had disquieted the monarchies of Europe in 1848 and had provoked their hostility to the Second Republic. But the Triple Alliance which was concluded the year after the murder of the tsar indicated the possible expediency of an understanding between the two great powers of the West and the East, in response to the combination of the three central powers of Europe,—though Bismarck after his fall revealed that in 1884 a secret treaty was concluded between Germany and Russia, which was, however, said to have in view a war between England and Russia. Internal dissension on the subject of colonial policy in the far East, followed by the fall of Jules Ferry and the Boulangist agitation were some of the causes which prevented France from strengthening her position in Europe by seeking a formal understanding with Russia in the first year of the reign of Alexander III. But when the Boulangist movement came to an end, entirely from the incompetency of its leader, it behoved the government of the Republic to find a means of satisfying the strong patriotic sentiment revealed in the nation, which, directed by a capable and daring soldier, would have swept away the parliamentary republic and established a military dictatorship in its place. The Franco-Russian understanding provided that means, and Russia was ready for it, having become, by the termination in 1890 of the secret treaty with Germany, not less isolated in Europe than France.

In July 1891, when the French fleet visited Kronstadt the incident caused such enthusiasm throughout the French nation that the exiled General Boulanger's existence would have been forgotten, except among his dwindling personal followers, had he not put an end to it by suicide two months later at Brussels. The Franco-Russian understanding united all parties, not in love for one another but in the idea that France was thereby about to resume its place in Europe. The Catholic Royalists ceased to talk of the restitution of the temporal power of the pope in their joy at the defence of the government of the republic for the most autocratic monarchy of Christendom; the Boulangists, now called Nationalists, hoped that it would lead to the war of revenge with Germany, and that it might also be the means of humiliating England, as shown by their resentment at the visit of the French squadron to Portsmouth on its way home from Kronstadt. It is, however, extremely improbable that the understanding and subsequent alliance would have been effected had the Boulangist movement succeeded. For the last thing that the Russian government desired was war with Germany; France's relations with it were sufficiently secured against German aggression on its frontier and financial from France; so a French plebiscitary government, having for its aim the restitution of Alsace and Lorraine, would have found no support in Russia. As the German chancellor, Count von Caprivi, said in the Reichstag on the 27th of November 1891, a few weeks after a Russian loan had been subscribed in France nearly eight times over, the naval visit to Kronstadt had not brought war nearer by one single inch. Nevertheless when in 1893 the Russian fleet paid a somewhat tardy return visit to Toulon, where it was reviewed by President Carnot, a party of Russian officers who came to Paris was received by the population of the capital, which less than five years before had acclaimed General Boulanger, with raptures which could not have been exceeded had they brought back to France the territory lost in 1871. In November 1894, Alexander III. died, and in January 1895, M. Casimir-Périer resigned the presidency of the Republic, to which he had succeeded only six months before on the assassination of M. Carnot. So it was left to Nicholas II. and President Félix Faure to proclaim the existence of a formal alliance between France and Russia. It appears that in 1891 and 1892, at the time of the first public manifestations of friendship between France and Russia, in the words of M. Ribot, secret conventions were signed by him, being foreign minister, and M. de Frecyinet, president of the council, which secured for France “the support of Russia for the maintenance of the equilibrium in Europe”; and on a later occasion the same statesman said that it was after the visit of the empress Frederick to Paris in 1891 that Alexander III. made to France certain offers which were accepted. The word “alliance” was not publicly used by any minister to connote the relations of France with Russia until the 10th of June 1895, when M. Hanotaux used the term with cautious vagueness amid the applause of the Chamber of Deputies. Yet not even when Nicholas II. came to France in October 1896 was the word “alliance” formally pronounced in any of the official speeches. But the reception given to the tsar and tsaritsa in Paris, where no European sovereign had come officially since William of Germany passed down the Champs Elysées as a conqueror, was of such a character that none could doubt that this was the consecration of the alliance. It was at last formally proclaimed by Nicholas II., on board a French man-of-war, on the occasion of the visit of the president of the Republic to Russia in August 1897. From that date until the formation of M. Briand's cabinet in 1900, nine different ministries succeeded one another and five ministers of foreign affairs; but they all loyally supported the Franco-Russian alliance, although its popularity diminished in France long before the war between Russia and Japan, which deprived it of its efficacy in Europe. In 1901 Nicholas II. came again to France and was the guest of President
Louvet at Compiegne. His visit excited little enthusiasm in the nation, which was disposed to attribute it to Russia’s financial need of France; while the Socialists, now a strong party which provided the Waldeck-Rousseau ministry with an important part of its majority in the Chamber, violently attacked the alliance of the Republic with a reactionary autocracy. However anomalous that may have been it did not prevent the whole French nation from welcoming the friendship between the governments of Russia and of France in its early stages. Nor can there be any doubt that the popular instinct was right in according it that welcome. France in its international relations was strengthened morally by the understanding and by the alliance, which also served as a check to Germany. But its association with Russia had not the results hoped for by the French reactionaries. It encouraged them in their opposition to the parliamentary Republic during the Dreyfus agitation, the more so because the Russian autocracy is anti-Semitic. It also made a Nationalist of one president of the Republic, Félix Faure, whose head was so turned by his imperial frequentations that he adopted some of the less admirable practices of princes, and also seemed ready to assume the bearing of an autocrat. His sudden death was as great a relief to the parliamentary Republicans as it was a disappointment to the plebeian party, which anti-Dreyfus, with its patriotic pretensions, had again made a formidable force in the land. But the election of the pacific and constitutional M. Louvet as president of the Republic at this critical moment in its history counteracted any reactionary influence which the Russian alliance might have had in France; so the general effect of the alliance was to strengthen the Republic and to add to its prestige. The visit of the tsar to Paris, the first paid by a friendly sovereign since the Second Empire, impressed a population, proud of its capital, by an outward sign which seemed to show that the Republic was not an obstacle to the recognition by the monarchies of Europe of the place still held by France among the great powers. Before M. Louvet laid down office the nation, grown more republican, saw the visit of the tsar followed by those of the kings of England and of Italy, who might never have been moved to present their respects to the French Republic had not Russia shown them the way.

While the French rejoiced at the Russian alliance chiefly as a check to the aggressive designs of Germany, they also liked the association of France with a power regarded as hostile to England. This traditional feeling was not discouraged by one of the chief artificers of the alliance, Baron Mohrenheim, Russian ambassador in Paris, who until 1884 had filled the same position in London, where he had not learned to love England, and who enjoyed in France a popularity rarely accorded to the diplomatic agent of a foreign power. An entente cordiale has since been initiated between England and France. But it is necessary to refer to the less agreeable relations which existed between the two countries, as they had some influence on the exterior policy of the Third Republic. France, the only nation outside of Europe, was faced with the problem of colonial expansion. But in its policy of colonial expansion, during the last twenty years of the 19th century, France constantly encountered England allover the globe. The first important enterprise beyond the seas seriously undertaken by France after the Franco-German War was, as we have seen, in Tunis. But even before that question had been mentioned at the congress of Berlin, in 1878, France had become involved in an adventure in the Far East, which in its developments attracted more public attention at home than the extension of French territory in northern Africa. Had these pages been written before the end of the 19th century it would have seemed necessary to trace the operations of France in Indo-China with not less detail than has been given to the establishment of the protectorate in Tunis. But French hopes of founding a great empire in the Far East came to an end with the partial resuscitation of China and the rise to power of Japan. As we have seen, Jules Ferry’s idea was that in colonial expansion France would find the means of recovering prestige after the defeat of 1870–71 in the years of recuperation when it was essential to be diverted from European complications. Jules Ferry was not a friend of Gambetta, in spite of later republican legends. But the policy of colonial expansion in Tunis and in Indo-China, associated with Ferry’s name, was projected by Gambetta to give satisfaction to France for the necessity, imposed, in his opinion, on the French government, of taking its lead in foreign affairs from Berlin. How Jules Ferry developed that system we know now from Bismarck’s subsequent expressions of regret at Ferry’s fall. He believed that, had Ferry remained in power, an amicable arrangement would have been made between France and Germany, a formal agreement having been almost concluded to the effect that France should maintain peaceable and friendly relations with Germany, while Bismarck supported France in Tunis, in Indo-China and generally in its schemes of overseas colonization. Even though the friendly attitude of Germany towards those schemes was not official the contrast was manifest between the benevolent tone of the German press and that of the English, which was generally hostile. Jules Ferry took his stand on the position that his policy was one not of colonial conquest, but of colonial conservation, that without Tunis, Algeria was insecure, that without Tongking and Annam, there was danger of losing Cochin-China, where the French had been in possession since 1861. It was on the Tongking question that Ferry fell. On the 30th of March 1885, on the news of the defeat of the French troops at Lang-Son, the Chamber refused to vote the money for carrying on the campaign by a majority of 306 to 149. Since that day public opinion in France has made amends to the memory of Jules Ferry. His patriotic foresight has been extolled. Criticism has not been spared for the opponents of his policy in parliament of whom the most conspicuous, M. Clémenceau and M. Ribot, have survived to take a leading part in public affairs in the 20th century. The attitude of the Parisian press, which compared Lang-Son with Sedan and Jules Ferry with Émile Ollivier, has been generally deplored, as has that of the public which was ready to offer violence to the fallen minister, and which was still so hostile to him in 1887 that the congress at Versaille was persuaded that there would be a revolution in Paris if it elected “the German Ferry” president of the Republic. Nevertheless his adversary in parliament, in the press and in the street have been justified—not owing to their superior sagacity, but owing to a series of unexpected events which the most foreseeing statesmen of the world never anticipated. The Indo-China dream of Jules Ferry might have led to a magnificent empire in the East to compensate for that which Dupleix lost and Napoleon failed to reconquer.

The Russian alliance, which came at the time when Ferry’s policy was justified in the eyes of the public, too late for him to enjoy any credit, gave a new impetus to the French idea of establishing an empire in the Far East. In the opinion of all the prophets of Europe the great international struggle in the near future was to be that of England with Russia for the possession of India. If Russia won, France might have a share in the dismembered Indian empire, of which part of the frontier was fortified with part of French Indo-China, since Burma had become British and Tongking French. Such aspirations were not formulated in white-books or in parliamentary speeches. Indeed, the apprehension of difficulty with England limited French ambition on the Siamese frontier. That did not prevent dangerous friction arising between England and France on the question of the Mekong, the river which flows from China almost due south into the China Sea traversing the whole length of French Indo-China, and forming part of the eastern boundary of Upper Burma and Siam. The aim of France was to secure the whole of the left bank of the Mekong, the highway of commerce from southern China. The opposition of Siam to this delimitation was believed by the French to be inspired by England, the supremacy of France on the Mekong river being prejudicial to British commerce with China. The inevitable rivalry between the two powers reached an acute crisis in 1893, the British ambassador in Paris being Lord Dufferin, who well understood the question, upper Burma having been annexed to India under
his viceroyalty in 1885. The matter was not settled until 1894; when not only was the French claim to the left bank of the Mekong allowed, but the neutrality of a 25-kilometre zone on the Siamese bank was conceded as open to French trade. It is said that at one moment in July 1893 England and France were more nearly at war than at any other international crisis under the Third Republic, not excluding that of Fashoda, though the acute tension between the governments was unknown to the public.

The Panama affair had left French public opinion in a nervous condition. Fantastic charges were brought not only in the press, but in the chamber of deputies, against newspapers and politicians of having accepted bribes from the British government. At the general election in August and September 1893 M. Clémenceau was pursued into his distant constituency in the Var by a crowd of Parisian politicians, who brought about his defeat less by alleging his connexion with the Panama scandal than by propagating the legend that he was the paid agent of England. The official republic, which changed its prime minister three times and its foreign minister twice in 1893, M. Devézie filling that post in the Ribot and Dupuy ministries and M. Casimir-Périer in his own, repudiated with energy the calumnies as to the attempted interference of England in French domestic affairs. But the successive governments were not in a mood to make concessions in foreign questions, as all France was under the glamour of the preliminary manifestations of the Russian alliance. This was seen, a few weeks after the elections, in the wild enthusiasm with which Paris received Admiral Avelane and his officers, who had brought the Russian fleet to Toulon to return the visit of the French fleet to Kronstadt in 1891. The death of Marshal MacMahon, who had won his first renown in the Crimea, and his funeral at the Invalides while the Russians were in Paris, were used to emphasize the fact that the allies before Sebastopol were no longer friends. The projector of the French empire in the Far East did not live to see this phase of the seeming justification of the policy which had cost him place and popularity. Jules Ferry had died on the 17th of March 1893, only three weeks after his triumphant rehabilitation in the political world by his election to the presidency of the Senate, the second post in the state. The year he died it seemed as though with the active aid of Russia and the sympathy of Germany the possessions of France in south-eastern Asia might have indefinitely expanded into southern China. A few years later the defeat of Russia by Japan and the rise of the sea-power of the Japanese practically ended the French empire in Indo-China. What the French already had at the end of the last century is virtually guaranteed to them only by the Anglo-Japanese alliance. It is in the irony of things that these possessions which were a sign of French rivalry with England should now be secured to France by England’s friendliness. For it is now recognized by the French that the defence of Indo-China is impossible.

Had the French dream been realized of a large expansion of territory into southern China, the success of the new empire would have been based on free Chinese labour and trade. This might have helped to enable France to rival England in the schemes, more important than those which arise from international difficulties—the reluctance of the French to establish themselves as serious colonists in their overseas possessions. We have noted how Algeria, which is nearer to Toulon and Marseilles than are Paris and Havre, has been comparatively neglected by the French, after eighty years of occupation, in spite of the amenity of its climate and its soil for European settlers. The new French colonial school advocates the withdrawal of France from adventures in distant tropical countries which can be reached only by long sea voyages, and the concentration of French activity in the northern half of the African continent. Madagascar is, as we have seen, counted as Africa in computing the area of French colonial territory. But it lies entirely outside the scheme of African colonization, and in spite of the loss of life and money incurred in its conquest, its retention is not popular with the new school, although the first claim of France to it was as long ago as the reign of Louis XIII., when in 1621 a company was founded under the protection of Richelieu for the colonization of the island. The French of the 19th and 20th centuries may well be considered less enterprising in both hemispheres than were their ancestors of the 17th, and Madagascar, after having been the cause of much ill-feeling between England and France under the Third Republic down to the time of its formal annexation, by the law of the 9th of August 1896, is not now the object of much interest among French politicians. On the African continent it is different. When the Republic succeeded to the Second Empire the French African possessions outside Algiers were inconsiderable in area. The chief was Senegal, which though founded as a French station under Louis XIII., was virtually the creation of Faidherbe under the Second Empire, even in a greater degree than were Tunis and Tongking of Jules Ferry under the Third Republic. There was also Gabun, which is now included in French Congo. These outposts in the tropics became the starting-points for the expansion of a French sphere of influence in north Africa, which by the beginning of the 20th century made France the nominal possessor of a vast territory stretching from the equatorial region on the Gulf of Guinea to the Mediterranean. A large portion of it is of no importance, including the once mysterious Timbuktu and the wilds of the waterless Sahara desert. But the steps whereby these wide tracts of wilderness and of valuable territory came to be marked on the maps in French colours, by international agreement, are important, as they were associated with the last serious official dispute between England and France before the period of entente. M. Hanotaux, who was foreign minister for the then unprecedented term of four years, from 1894 to 1898, with one short interval of a few months, has thrown an instructive light on the feeling with which French politicians up to the end of the 19th century regarded England. He declared in 1909, with the high authority of one who was during years of Anglo-French tension the mouth-piece of the Republic in its relations with other powers, that every move in the direction of colonial expansion made by France disquieted and irritated England. He complained that when France, under the stimulating guidance of Jules Ferry, undertook the reconstitution of an overseas domain, England barred the way—in Egypt, in Tunis, in Madagascar, in Indo-China, in the Congo, in Oceania. Writing with the knowledge of an ex-foreign minister, who had enjoyed many years of retirement to enable him to weigh his words, M. Hanotaux asserted without any qualification that when he took office England “had conceived a triple design, to assume the position of heir to the Portuguese possessions in Africa, to destroy the independence of the South African republics, and to remain in perpetuity in Egypt.” We have not to discuss the truth of those propositions, we have only to note the tendency of French policy; and in so doing it is useful to remark that the official belief of the Third Republic in the last period of the 19th century was that England was the enemy of French colonial expansion all over the globe, and that in the so-called scramble for Africa in 1885 France established the schemes of France. M. Hanotaux, with the authority of official knowledge, indicated that the English project of a railway from the Cape of Good Hope to Cairo was the provocation which stimulated the French to essay a similar adventure; though he denied that the Marchand mission and other similar expeditions about to be mentioned were conceived with the specific object of preventing the accomplishment of the British plan. The explorations of Stanley had demonstrated that access to the Great Lakes and the Upper Nile could be effected as easily from the west coast of Africa as from other directions. The French, from their ancient possession of Gabun, had extended their operations far to the east, and had by treaties with European powers obtained the right bank of the Ubanghi, a great affluent of the Congo, as a frontier between their territory and that of the Congo Independent State. They thus found themselves, with respect to Europe, in possession of a region which approached the valley of the Upper Nile. Between the fall of Jules Ferry in 1885 and the beginning of the Russian alliance came a period
of decreased activity in French colonial expansion. The unpopularity of the Tongking expedition was one of the causes of the popularity of General Boulanger, who diverted the French public from distant enterprises to a contemplation of the German frontier, and when Boulanger came to an end the Panama affair took its place in the interest it excited. But the colonial party in France did not lose sight of the possibility of establishing a position on the Upper Nile. The partition of Africa seemed to offer an occasion for France to take compensation for the English occupation of Egypt. In 1892 the Budget Commission, on the proposal of M. Étienne, deputy for Oran, who had three times been colonial under secretary, voted 300,000 francs for the despatch of a mission to explore and report on those regions, which had not had much attention since the days of Emin. But the project was not then carried out. Later, parliament voted a sum six times larger for strengthening the French positions on the Upper Ubangi and their means of communication with the coast. But Colonel Montreuil’s expedition, which was the consequence of this vote, was diverted, and the 1,800,000 francs were spent at Loango, the northern point of the Congo coast itself. That coast, the French territory which lies between Liberia and the British Gold Coast Colony, where a prolonged war ensued with Samory, a Nigerian chieftain. In September 1894, M. Delcassé being colonial minister, M. Liottard was appointed commissioner of the Upper Ubangi with instructions to extend French influence in the Bahr-el-Ghazal up to the Nile. In addition to official missions, numerous expeditions of French explorers took place in Central Africa during this period, and negotiations were continually going on between the British and French governments. Towards the end of 1895 Lord Salisbury, who had succeeded Lord Kimberley at the foreign office, informed Baron de Courcel, the French ambassador, that an expedition to the Upper Nile was projected for the purpose of putting an end to Mahdism. M. Hanotaux was not at this moment minister of foreign affairs. He had been successively by M. Berthelot, the eminent chemist, who resigned that office on the 26th of March 1896, a month before the fall of the Bourgeois cabinet of which he was a member, in consequence of a question raised in the chamber on this subject of the English expedition to the Soudan. According to M. Hanotaux, who returned to the Quai d’Orsay, in the Méline ministry, on the 29th of April 1896, Lord Salisbury at the end of the previous year, in announcing the expedition confidentially to M. de Courcel, had assured him that it would not go beyond Dongola without a preliminary understanding with France. There must have been a misunderstanding on this point, as after reaching Dongola in September 1896 the Anglo-Egyptian army proceeded up the Nile in the direction of Khartoum. Before M. Hanotaux resumed office the Marchand mission had been formally planned. On the 24th of February 1896 M. Gueysses, colonial minister in the Bourgeois ministry, had signed Captain Marchand’s instructions to the effect that he must march through the Upper Ubangi, in order to extend French influence as far as the Nile, and try to reach that river before Colonel Colville, who was leading an expedition from the East. He was also advised to conciliate the Mahdi if the aim of the mission could be benefited thereby. M. Liottard was raised to the rank of the Upper Ubangi, and a despatch to him the new colonial minister, M. André Lebon, wrote that the Marchand mission was not to be considered a military enterprise, it being sent out with the intention of maintaining the political line which for two years M. Liottard had persistently been following, and of which the establishment of France in the basin of the Nile ought to be the crowning reward. Two days later, on the 25th of June 1896, Captain Marchand embarked for Africa. This is not the place for a description of his adventures in crossing the continent or when he encountered General Kitchener at Fashoda, two months after his arrival there in July 1898 and a fortnight after the battle of Omdurman and the capture of Khartoum. The news was made known to Europe by the sirdar’s telegrams to the British government in September announcing the presence of the French mission at Fashoda. Then ensued a period of acute tension between the French and English governments, which gave the impression to the public that war between the two countries was inevitable. But those who were watching the situation in France on the spot knew that there was no question of fighting. France was unprepared, and was also involved in the toils of the Dreyfus affair. Had the situation been that of a year later, when the French domestic controversy was ending and the Transvaal War beginning, England might have been in a very difficult position. General Kitchener declined to recognize a French occupation of any part of the Nile valley. A long discussion ensued between the British and French governments, which was ended by the latter deciding on the 6th of November 1898 not to maintain the Marchand mission at Fashoda. Captain Marchand refused to return to Europe by way of the Nile and Lower Egypt, marching across Abyssinia to Jibuti in French Somaliland, where he embarked for France. He was received with well-merited enthusiasm in Paris. But the most remarkable feature of his reception was that the ministry became so alarmed lest the popularity of the hero of Fashoda should be at the expense of that of the parliamentary republic, that it put an end to the public acclamations by despatching him secretly from the capital—a somewhat similar treatment having been accorded to General Dodds in 1893 on his return to France after conquering Dahomey. The Marchand mission had little effect on African questions at issue between France and Great Britain, as a great settlement had been effected while it was on its way across the continent. On the 14th of June 1898, the day before the fall of the Méline ministry, when M. Hanotaux finally quitted the Quai d’Orsay, a convention of general delimitation was signed at Paris by that minister and by the British ambassador, Sir Edmund Monson, which as regards the respective claims of England and France covered in its scope the whole of the northern half of Africa from Sene-gambia and the Congo to the valley of the Nile. Comparatively little attention was paid to it amid the exciting events which followed, so little that M. de Courcel has officially recorded that three months later, on the eve of the Fashoda incident, Lord Salisbury declared to him that he was not sufficiently acquainted with the geography of Africa to express an opinion on certain questions of delimitation arising out of the success of the British expedition on the Upper Nile. The convention of June 1898 was, however, of the highest importance, as it affirmed the junction into one vast territory of the three chief African domains of France, Algeria and Tunis, Senegal and the Niger, Chad and the Congo, thus conceding to France the whole of the north-western continent with the exception of Morocco, Liberia and the European colonies on the Atlantic. This arrangement, which was completed by an additional convention on the 31st of March 1899, made Morocco a legitimate object of French ambition.

The other questions which caused mutual animosity between England and France in the decline of the 19th century had nothing whatever to do with their conflicting international interests. The offensive attitude of the English press towards France on account of the Fashoda affair was repaid by the French in their criticism of the Boer War. When the sentiment of mutual irritation had become less acute, the press of the two countries was moved by certain influences to recognize that it was in their interest to be on good terms with one another. The importance of their commercial relations was brought into relief as though it were a new fact. At last in 1903 state visits between the rulers of England and of France took place in their respective capitals, for the first time since the early days of the Second Empire, followed by an Anglo-French convention signed on the 8th of April 1904. By this an arrangement was come to on outstanding questions of controversy between England and France in various parts of the world. France undertook not to interfere with the action of England in Egypt,
while France made a like undertaking as to French influence in Morocco. France conceded certain of its fishing rights in Newfoundland, which had been a perpetual source of irritation between the two countries for nearly two hundred years since the treaty of Utrecht of 1713. In return England made several concessions to France in Africa, including that of the Los Islands off Sierra Leone and some rectifications of frontier on the Gambia and between the Niger and Lake Chad. Other points of difference were arranged as to Siam, the New Hebrides and Madagascar. The convention of 1904 was on the whole more advantageous for England than for France. The free hand which England conceded to France in dealing with Morocco was a somewhat burdensome gift owing to German interference; but the incidents which arose from the Franco-German conflict in that country are as yet too recent for any estimate of their possible consequences.

One result was the retirement of M. Delcassé from the foreign office on the 6th of June 1905. He had been foreign minister for seven years, a consecutive period of rare length, only once exceeded in England since the creation of the office, when Castlereagh held it for ten years, and once in France, when the Ministry of Foreign Affairs was restored in the Third Republic. He first went to the Quai d'Orsay in the Brisson ministry of June 1898, remained there during the Dupuy ministry of the same year, was reappointed by M. Waldeck-Rousseau in his cabinet which lasted from June 1899 to June 1902, was retained in the post by M. Combes till his ministry fell in January 1905, and again by his successor M. Rouvier till his own resignation in June of that year. M. Delcassé had thus an uninterrupted reign at the foreign office during a long critical period of transition both in the interior politics of France and in its exterior relations. He went to the Quai d'Orsay when the Dreyfus agitation was most acute, and left it when parliament was absorbed in discussing the separation of church and state. He saw the Franco-Russian alliance lose its popularity in the country even before the Russian defeat by the Japanese in the last days of his ministry. Although in the course of his official duties at the colonial office he had been partly responsible for some of the expeditions sent to Africa for the purpose of checking British influence, he was fully disposed to pursue a policy which might lead to a friendly understanding with England. In this he differed from M. Hanotaux, who was essentially the man of the Franco-Russian alliance, owing to it much of his prestige, including his election to the French Academy, and Russia, to which he gave exclusive allegiance, was then deemed to be primarily the enemy of England. M. Delcassé on the contrary, from the first, desired to assist a rapprochement between England and Russia as preliminary to the arrangement he proposed between England and France. He was foreign minister when the tsar paid his second visit to France, but there was no longer the national unanimity which welcomed him in 1896. M. Delcassé also accompanied President Loubet to Russia when he returned the tsar's second visit in 1902. But exchange of compliments between France and Russia were no longer to be the sole international ceremonials within the attributes of the French foreign office; M. Delcassé was minister when the procession of European sovereigns headed by the kings of England and of Italy in 1903 came officially to Paris, and he went with M. Loubet to London, and to Rome on the president's visit returns to those capitals—the latter being the immediate cause of the rupture of the concordat with the Vatican, though M. Delcassé was essentially a concordat minister. His retirement from the Rouvier ministry in June 1905 was due to pressure from Germany in consequence of his opposition to German interference in Morocco. His resignation took place just a week after the news had arrived of the destruction of the Russian fleet by the Japanese, which completed the disabusement of the one ally of France. The impression was current in France that Germany wished to give the French nation a fright before the understanding with England had reached an effective stage, and it was actually believed that the resignation of M. Delcassé averted a declaration of war. Although that belief revived to some extent the fading enmity of the French towards the conquerors of Alsace-Lorraine, the fear which accompanied it moved a considerable section of the press to toll a signal note of profound misunderstanding with Germany in preference to, or even at the expense of, friendly relations with England. M. Clémenceau, who only late in life came into office, and attained it at the moment when a better understanding with England was progressing, had been throughout his long career, of all French public men in all political groups, the most consistent friend of England. His presence at the head of affairs was a guarantee of amicable Anglo-French relations, so far as they could be protected by statesmanship.

By reason of the increased duration and stability of ministries, the personal influence of ministers in directing the foreign policy of France has in one sense become greater in the 20th century than in those earlier periods when France had first to recuperate its strength after the war and then to take its exterior policy from Germany. Moreover, not only have cabinets lasted longer, but the foreign minister has often been retained in a succession of them. Of the thirty years which in 1909 had elapsed since Marshal MacMahon retired and the republic was governed by republicans, in the first fifteen years from 1879 to 1894 fourteen different men served as foreign ministers, and in the third fifteen years, six French foreign affairs, while six sufficed for the fifteen years succeeding the latter date. One must not, however, exaggerate the effect of this greater stability in office-holding upon continuity of policy, which was well maintained even in the days when there was on an average a new foreign minister every year. Indeed the most marked breach in the continuity of the foreign policy of France has been made in that later period of long terms of office, which, with the repudiation of the Concordat, has seen the withdrawal of the French protectorate over Roman Catholic missions in the East—though it is too soon to estimate the result. In another respect France has under the republic departed a long way from a tradition of the Quai d'Orsay. It no longer troubles itself on the subject of nationalities. Napoleon III, who had more French temperament than French blood in his constitution, was an idealist on this question, and one of the causes of his own downfall and the defeat of France was his sympathy in this direction with German unity. Since Sedan little has been done in France to further the doctrine of nationalities. A faint echo of it was heard during the Boer war, but French sympathy with the struggling Dutch republics of South Africa was based rather on anti-English sentiment than on any abstract theory. (J. E. C. B.)

BIBLIOGRAPHY OF FRENCH HISTORY.—The scientific study of the history of France only begins with the 16th century. It was not till first the first, then the second, and last the third period of the 19th century that a servile imitation of antiquity. Paulus Aemiliius of Verona (De rebus gestis Francorum, 1517), who may be called the first of modern historians, merely applies the oratorical methods of the Latin orators; the historical studies of the century (1631) of the history emancipates itself; Catholics and Protestants alike turn to it for arguments in their religious and political controversies. François Hotman published (1574) his Franco-Gallia; Claude Fauchet his Antiquités galantes et françaises (1579); Etienne Pasquier his Recherches de la France (1611), "the only work of erudition of the 16th century which one can read through without being bored. Amateurs like Petau, A. de Thou, Bongars and others, henceforth read and reflected by their studies without their knowledge of the past: Pierre Pithou, one of the authors of the Sataire Ménippe, published the earliest annals of France (Annales Francorum, 1586, and Historiae Francorum scriptores coetanei X., 1599). In 1617 the principal chroniclers of the Crusades. Others made a study of chronology like J. J. Scaliger (De emendationibus temporum, 1583; Thesaurus temporum, 1606), sketched the history of literature, like François Guéde, sieur de La Croix in Maine (Bibliothèque française, 1584), and Antoine du Verdier (Catalogue de tous les auteurs qui ont écrit ou traduit en françois, 1583), or discussed the actual principles of historical research, like Jean Bodin (Methodus ad faciendum historiae cognitionem, 1566) and Henri Lancelot Voisin de La Popelinière (Frontispice historique, 1633).

But the writers of history are as yet very inexperienced; the Histoire générale des rois de France of Bernard de Girard, seigneur de Haillan (1576), the Grandes Annales de France of François de Belleforest (1592–1604), the Histoire générale de l’histoire de France of Jean de Serres (1597), the Histoire générale de France depuis Pharamond de Scipion Dupleix (1621–1645), the Histoire de France (1643–1651) of François Eudes de Mézray, and above all his Abrégé chronologique de l’histoire
de France (1668), are compilations which were eagerly read when they appeared, but are worthless nowadays. Historical research lacked leaders and trained workers; it found them all in the 17th century, the golden age of learning which was honoured alike by laymen and clergy of the two middle orders, the Sacerdotii, the Benedictines of the congregation of St Mau. The publication of original documents was carried on with enthusiasm. To André Duchesne we owe two great collections of chronicles: the Historiae Notarum (5 vols. 1775–1789) and the Annales ordinum sancti Benedicti (10 vols. 1770–1789), a work of more than historical interest, since it includes the statutes and the military and civil law of the monasteries. The eighteenth century produced a series of learned publications, continued by his son François (5 vols., 1636–1649). These publications are due to a part of his prodigious activity: his papers and manuscripts, preserved in the Bibliothèque nationale at Paris, amount to 10,000 volumes. Charles du Cange, Professor of Law at the University of Caen, published Histoire de la langue française (5 vols., 1675–1705). In 1673, René Prosper Tassini published a Nouveaux Traité de diplomatique (6 vols., 1750–1765), others were undertaking the Art de vérifier les dates (1750; new and much enlarged edition in 1770). Still others, like Jean-Baptiste d'Anville (1697–1786), adduced the aids of the sciences in this research. Among the scientific works which were now being published, those in geography and navigation and those relating to the history of the church and the law were the most popular; and these, in their turn, were crowned with success.

In the second half of the 18th century, the ardour of the Benedictines of St Mau diminished, and scientific work passed more and more into the hands of laymen. The Académie des Inscriptions et Belles-Lettres, founded in 1635, continued to be the chief instrument, numbering among its members Denis François Secqueville, who continued the collection of Ordinances des rois de France, begun (1723) by J. de la Laurencie; J.-B. de la Curme de Sainte-Foy, who prepared the second part of the collection of the chartes, the chartes et diplômes, and added the directory of the chartes and diplômes; Jean Baptiste Haureau, who continued the publication of the Scriptores Hiberniae; and L. G. de Bréquigny, who was one of the two persons who published the collectanea, the Chronicon et notitia rerum et personarum, the Journal diplomatique, and the Collection des minima

Historiography is the study of the methods and practices of historians. It is a branch of the history of knowledge, as is the study of the methods and practices of philosophers and of the methods and practices of religion. whole of the 19th century, and even longer, had a strong influence on historical production. The section of the Institut de France, which in 1816 assumed the old name of Académie des Inscriptions et Belles-lettres, began to reissue the two series of Mémoires and of the Notices et extraits des manuscrits tirés de la bibliothèque royale; the first volume had appeared in 1787; began (1844) that of les Mémoires présentés par divers savants et les Comptes rendus (subject index 1857–1900, by G. Ledos, 1906); and continued the Recueil des historiens de France, the plan of which was enlarged by geographical sections in 1838, and the last volume came out in 1906. It contains many references to the Ordonnances et la Table chronologique des diplomatiques. During the reign of Louis Philippe, the ministry of the interior reorganized the administration of the archives of the departments, communes, and parlements, and the libraries of the French and of the foreign Legations; the publications of the Académie des inscriptions et belles-lettres was composed of the Rapport au ministre, by G. Servois, (1802).

In 1852, a new public instruction a committee, which has been called since 1881 the Comité des Travaux historiques et de l’Archéologie, has begun the publication of the Recueil des travaux historiques et de l’archéologie, which was reorganized in 1868 (see Rapport des travaux, 1884). For each volume, the minute is divided into (1) the sessioné, which gives the most important information (see the Rapport au ministre, by G. Servois, 1802).

In 1834, a ministry of the interior founded a committee, which has been called since 1881 the Comité des Travaux historiques et de l’Archéologie, which was reorganized in 1868 (see Rapport des travaux, 1884). For each volume, the minute is divided into (1) the sessioné, which gives the most important information (see the Rapport au ministre, by G. Servois, 1802).

the accounts found in those legal works of the middle ages written in those neo-Celtic dialects, the most important and the greater number of which belong to Ireland. A reconstruction from them is always hazardous, however delicate and scientific be the criticism which is brought to bear on it, as in the case of d’Arbois de Jubainville, for example. Moreover, in the historical evolution of French institutions those of the Celts or Gauls are of little importance. Not one of them can be shown to have survived in later law. What has survived of the Celtic race is the blood and temperament, still found in a great many Frenchmen, certain traits which the ancients remarked in the Gauls being still recognizable: bellum gerere et argute loqui.

Roman Period.—It was the Roman conquest and rule which really formed Gaul, for she was Romanized to the point of losing almost completely which persists most stubbornly in a conquered nation, namely, the language; the Breton-speaking population came to France later, from Britain. The institutions of Roman Gaul became identical with those of the Roman empire, provincial and municipal government undergoing the same evolution as in the other parts of the empire. It was under Roman supremacy too, as M. d’Arbois de Jubainville has shown, that the ownership of land became personal and free in Gaul. The law for the Gallo-Romans was that which was administered by the conventus of the magistrate; there are only a few peculiarities, mere Gallicisms, resulting from conventions or usage, which are pointed out by Roman jurisconsults of the classical age. The administrative reformation of Diocletian and Constantine applied to Gaul as to the rest of the empire. Gaul under this rule consisted of seventeen provinces, divided between two dioceses, ten in the diocese of the Gauls, under the authority of the praetorian prefect, who resided at Treves; and the other seven in the diocese septem provinciarum, under the authority of a vicarius. The Gallo-Romans became Christian with the other subjects of the empire; the Church extended thither her powerful organization modelled on the administrative organization, each civitas having a bishop, just as it had a curia and municipal magistrates. But, although endowed with privileges by the Christian emperors, the Church did not yet encroach upon the civil power. She had the right of acquiring property, of holding councils, subject to the imperial authority, and of the free election of bishops. But only the first germs of ecclesiastical jurisdiction are to be traced. In virtue of the laws, the bishops were privileged arbitrators, and in the matter of public sins exercised a disciplinary jurisdiction over the clergy and the faithful. In the second half of the 4th century, monasteries appeared in Gaul. After the fall of the Western empire, there was left to the Gallo-Romans as an expression of its law, which was also theirs, a written legislation. It consisted of the imperial constitutions, contained in the Gregorian, Hermogenian and Thedosian codes (the two former being private compilations, and the third an official collection), and the writings of the five jurists (Gauis, Papiian, Paulus, Ulpian and Modestinus), to which Valentinian III. had in 426 given the force of law.

The Barbarian Invasion.—The invasions and settlements of those barbarians open a new period. Though there were robbery and violence in every case, the various barbarian kingdoms set up in Gaul were established under different conditions. In those of the Burgundians and Visigoths, the owners of the great estates, which had been the prevailing form of landed property in Roman Gaul, suffered partial disposal, according to a system the rules regulating which can, in the case of the Burgundians, be traced almost exactly. It is doubtful whether a similar process took place in the case of the Frankish settlements, but their first conquests in the north and east seem to have led to the extermination or total expulsion of the Gallo-Roman population. It is impossible to say to what extent, in these various settlements, the system of collective property prevailing among the Germanic tribes was adopted. Another important difference was that, in embracing Christianity, some of the barbarians became Arians, as in the case of the Visigoths and Burgundians; others Catholic, as in the case of the Franks. This was probably the main cause of the absorption of the other kingdoms into the Frankish monarchy. In each case, however, the barbarian king appeared as wishing not to overthrow the Roman administration, but to profit by its continuation. The kings of the Visigoths and Burgundians were at first actually representatives of the Western empire, and Clovis himself was ready to accept from the emperor Anastasius the title of consul; but these were but empty forms, similar to the fictitious titles which long existed or still exist between China or Turkey and certain parts of their former empires, now separated from them for ever.

As soon as the Merovingian monarch had made himself master of Gaul, he set himself to maintain and keep in working order the administrative machinery of the Romans, save that the administrative unit was henceforth no longer the provincia but the civitas, which generally took the name of pagus, and was placed under the authority of a count, comes or grafio (Grail). Perhaps this was not entirely an innovation, for it appears that at the end of the Roman supremacy certain civitates had already a comes. Further, several pagi could be united under the authority of a dux. The pagus seems to have generally been divided into hundreds, centenarii.

But the Roman administrative machinery was too delicate to be handled by barbarians; it could not survive for long, but underwent changes and finally disappeared. Thus the Merovingians tried to levy the same direct taxes as the Romans had done, the capitation terrena and the capitation humana, but they ceased to be imposed reassessed periodically in accordance with the total sum fixed as necessary to meet the needs of the state, and became fixed annual taxes on lands or persons; finally, they disappeared as general imposts, continuing to exist only as personal or territorial dues. In the same way the Roman municipal organization, that of the curiae, survived for a considerable time under the Merovingians, but was used only for the registration of written deeds; under the Carolingians it disappeared, and with it the old senatorial nobility which had been that of the Empire. The administration of justice (apart from the king’s tribunal) seems to have been organized in a system borrowed partly from Roman and partly from the Frankish and Germanic institutions; it naturally tends to assume popular forms. Justice is administered by the count (comes) or his deputy (centenarius or vicarius), but on the verdict of notables called in the texts boni homines or rachimburgi. This takes place in an assembly of all the free subjects, called mallus, at which every free man is bound to attend at least a certain number of times a year, and in which are promulgated the general acts emanating from the king. The latter could issue commands or prohibitions under the name of bonum, the violation of which entailed a fine of go solidi; the king also administered justice (in palatio), assisted by the officials of his household, his jurisdiction being unlimited and at the same time undefined. He could hear all causes, but was not bound to hear any, except, apparently, accusations of deliberate failure of justice and breach of trust on the part of the rachimburgi.

But what proved the great disturbing element in Gallo-Roman society was the fact that the conquerors, owing to their former customs and the degree of their civilization, were all warriors, men whose chief interest was to become practised in the handling of arms, and whose normal state was that of war. It is true that under the Roman empire all the men of a civitas were obliged, in case of necessity, to march against the enemy, and under the Frankish monarchy the count still called together his pagenses for this object. But the condition of the barbarian was very different; he lived essentially for fighting. Hence those gatherings or annual reviews of the Campus Martius, which continued so long, in Austrasia at least. They constituted the chief armed force; for mercenary troops, in spite of the assertions of some to the contrary, play at this period only a small part. But this military class, though not an aristocracy (for among the Franks the royal race alone was noble), was to a large extent independent, and the king had to attach those leudes or fidèles to himself by gifts and favours. At the same time the authority of the king gradually underwent a
change in character, though he always claimed to be the successor of the Roman emperor. It gradually assumed that domestic or personal character that, among the Germans, marked most of the relations between men. The household of the king gained in political importance, by reason that the heads of the principal offices in the palace became at the same time high public officials. There was, moreover, a body of men more especially attached to the king, the antrusions (q.v.) and the commensals (convivae regis) whose weregeld (i.e. the price of a man's life in the system of compensation then prevalent) was three times greater than that of the other subjects of the same race.

The Frankish monarch also had the power of making laws, which he exercised after consulting the chief men of the kingdom, both lay and ecclesiastical, in the placta, which were meetings differing from the Campus Martius and apparently modelled principally on the councils of the Church. But throughout the kingdom in many places the direct authority of the king over the people ceased to make itself felt. The immunities, granted chiefly to the great ecclesiastical properties, limited this authority in a curious way by forbidding public officials to exercise their functions in the precinct of land which was immunitas. The judicial and fiscal rights frequently passed to the landowner, who in any case became of necessity the intermediary between the supreme power and the people. In regard to this last point, moreover, the case seems to have been the same with all the great landowners or potentae, whose territory was called potentiae, and who gained a real authority over those living within it; later in the middle ages they were called homines potentatibus (hommes de poëte).

Other principles, arising perhaps less from Germanic custom strictly speaking than from an inferior level of civilization, also contributed towards the weakening of the royal power. The monarch, like his contemporaries, considered the kingdom and the rights of the king over it to be his property; consequently, he had the power of dealing with it as if it were a private possession; it is thus which gave rise to the concessions of royal rights to individuals, and later to the partitions of the kingdom, and then of the empire, between the sons of the king or emperor, to the exclusion of the daughters, as in the division of an inheritance in land. This proved one of the chief weaknesses of the Merovingian monarchy.

In order to rule the Gallo-Romans, the barbarians had had inevitably to ask the help of the Church, which was the representative of Roman civilization. Further, the Merovingian monarch and the Catholic Church had come into close alliance in their struggle with the Arians.

The result for the Church had been that she gained new privileges, but at the same time became to a certain extent dependent. Under the Merovingians the election of the bishop a clerio et populo is only valid if it obtains the assent (assensus) of the king, who often directly nomi nates the prelate. But at the same time the Church retains her full right of acquiring property, and has her jurisdiction partially recognized; that is to say, she not only exercises more freely than ever a disciplinary jurisdiction, but the bishop, in place of the civil power, administers civil and criminal justice over the clergy. The Church had for a long time forbidden the clergy to cite one another before secular tribunals; they had also, in the 6th century, forbidden secular judges under pain of excommunication to cite before them and judge the clergy, without permission of the bishop. A decree of Clotaire II. (614) acknowledged the validity of these claims, but not completely; a precise interpretation of the text is, however, difficult.

The Merovingian dynasty perished of decay, amid increasing anarchy. The crown passed, with the approval of the papacy, to an Austrasian mayor of the palace and his family, one of those mayors of the palace (i.e. chief officer of the king's household) who had been the last support of the preceding dynasty. It was then that there developed a certain number of institutions, which offered themselves as useful means of consolidating the political organism, and were in reality the direct precursors of feudalism. One was the royal benefice (beneficium), of which, without doubt, the Church provided both the model and, in the first instance, the material. The model was the precaria, a form of concession by which it was customary for the Church to grant the possession of her lands to free men; this practice she herself had copied from the five-years leases granted by the Roman exchequer. Gradually, however, the precaria had become a concession made, in most cases, free and for life. As regards the material, when the Austrasian mayors of the palace (probably Charles Martel) wished to secure the support of the fidèles by fresh benefits, the royal treasury being exhausted, they turned to the Church, which was at that time the greatest landowner, and took lands from her to give to their warriors. In order to disguise the robbery it was decided—perhaps as an afterthought—that these lands should be held as precariae from the Church, or from the monastic houses which had furnished them. Later, when the royal treasury was reorganized, the grants of land made by the kings naturally took a similar form: the beneficium, as a free grant for life. Under the Merovingians royal grants of land were in principle made in full ownership, except to ecclesiastics, whose beneficium was made for a revocation under certain circumstances. No special services seem to have been attached to the benefice, whether granted by the king or by some other person, but, in the second half of the 9th century at least, the possession of the benefice is found as the characteristic of the military class and the form of their pay. This we find clearly set forth in the treatise de ecclesiis et capellis of Hincmar of Reims. The beneficium, in obedience to a natural law, soon tended to crystallize into a perpetual and hereditary right. Another institution akin to the beneficium was the senioratus; by the commendatio, a form of solemn contract, probably of Germanic origin, and chiefly characterized by the placing of the hands between those of the lord, a man swore absolute fidelity to another man, who became his senior. It became the generally received idea (as expressed in the capitularies) that it was natural and normal for every free man to have a senior. At the same time a benefice was never granted unless accompanied by the commendatio of the beneficiary to the grantor. As the most important seniores were thus bound to the king and received from him their benefices, he expected through them to command their men; but in reality the king disappeared little by little in the senior. The king granted as benefices not only lands, but public functions, such as those of count or dux, which thus became possessions, held, first for life, and later as hereditary properties. The Capitulary of Kiersy-sur-Oise (877), which was formerly considered to have made sires legally and generally hereditary, only proves that it was already the custom for benefices of this kind, honorae, to pass from the father to one of the sons.

Charlemagne, while sanctioning these institutions, tried to arrest the political decomposition. He reorganized the administration of justice, fixing the respective jurisdictions of the chancellor and the centenarius, substituting for the rachim-burgii permanent scabini, chosen by the count in the presence of the people, and defining the relations of the count, as the representative of the central authority, with the capitales and justices of immunitates and potestates. He reorganized the army, determining the obligations and the military outfit of free men according to their means. Finally, he established those regular inspections by the missi dominici which are the subject of so many of his capitularies. From the De ordine palatii of Hincmar of Reims, who follows the account of a contemporary of the great emperor, we learn that he also regularly established two general assemblies, contentus or placta, in the year, one in the autumn, the other in the spring, which were attended by the chief officials, lay and ecclesiastical. It was here that the capitularies (q.v.) and all important measures were first drawn up and then promulgated. The revenues of the Carolingian monarch (which are no longer indenial with the finances of the state) consisted chiefly in the produce of the royal lands (vilias), which the king and his suite often came and
consumed on the spot; and it is known how carefully Charlemagne regulated the administration of the *villa*. There were also the free gifts which the great men were bound, according to custom, to bring to the *conventus*, the contributions of this character from the monasteries practically amounting to a tax; the regular personal or territorial dues into which the old taxes had resolved themselves; the profits arising from the courts (the *royal bannum*, and the *freedum*, or part of the compensation-money which went to the king); finally, numberless requisitions in kind, a usage which had without doubt existed continuously since Roman times. The Church was loaded with honours and had added a fresh prerogative to her former privileges, namely, the right of levying a real tax in kind, the *tithe*. Since the 3rd century she had tried to exact the payment of tithes from the faithful, interpreting as applicable to the Christian clergy the texts in the Old Testament bearing on the Levites; Gallican councils had repeatedly proclaimed it as an obligation, though, it appears, with little success. But from the reign of Pippin the Short onwards the civil law recognized and sanctioned this obligation, and the capitularies of Charles the Great and Louis the Debonnaire contain numerous provisions dealing with it. Ecclesiastical jurisdiction extended farther and farther, but Charlemagne, the protector of the papacy, maintained firmly his authority over the Church. He nominated its dignitaries, both bishops and abbots, who were true ecclesiastical officials, parallel with the lay officials. In each *pagan*, bishop and count owed each other mutual support, and the *missi* on the same circuit were ordinarily a count and a bishop. In the first collection of capitularies, that of Ansegisus, two books out of four are devoted to ecclesiastical capitularies.

What then, was the private and criminal law of this Frankish monarchy which had come to embrace so many different races? The men of Roman descent continued under the Roman law, and the conquerors could not hope to impose their customs upon them. The authorized expression of the Roman law was henceforth to be found in the *Romanae Leges Barbarorum* and *Breviarium Alarici*, drawn up by order of Alaric II, in 506. It is an abridgment of the codes, of that of Theodosius especially, and of certain of the writings of the jurists included under the Law of Citations. As to the barbarians, they had hitherto had nothing but customs, and these customs, of which the type nearest to the original is to be found in the oldest text of the *Lex Salica*, were nothing more than a series of tariffs of compensations, that is to say, sums of money due to the injured party or his family in case of crimes committed against individuals, for which crimes these compensations were the only penalty. They also introduced a barbarous system of trial, that by compurgation, i.e. exculpation by the oath of the defendant supported by a certain number of *cojurantes*, and that by ordeal, later called *judicium Dei*. In each new kingdom the barbarians naturally kept their own laws, and when these men of different races all became subject to the Frankish monarchy, there evolved itself a system (called the *personnalité des lois*) by which every subject had, in principle, the right to trial by his race, which he enjoyed by birth (or sometimes for some other reason, such as emancipation or marriage). When the two adversaries were of different race, it was the law of the defendant which had to be applied. The customs of the barbarians had been drawn up in Latin. Sometimes, as in the case of the first text of the Salic law, the system on which they were compiled is not exactly known; but it was generally done under the royal authority. At this period only these written documents bear the name of "law" (*leges Romanorum; leges barbarorum*), and at least the tacit consent of the people seems to have been required for these collections of laws, in accordance with an axiom laid down in a later capitulary; *lex fit consensus populi et constitutione regis*. It is noteworthy, too, that in the process of being drawn up in Latin, most of the *leges barbarorum* were very much Romanized.

In the midst of this diversity, a certain number of causes tended to produce a partial unity. The capitularies, which had in themselves the force of law, when there was no question of modifying the *leges*, constituted a legislation which was the same for all; often they inflicted corporal punishment for grave offences, which applied to all subjects without distinction. Usage and individual convenience led to the same result. The Gallo-Romans, and even the Church itself, to a certain extent, adopted the methods of trial introduced by the Germans, as was likely in a country relapsing into barbarism. On the other hand, written acts became prevalent among the barbarians, and at the same time they assimilated a certain amount of Roman law; for these acts continued to be drawn up in Latin, after Roman models, which were in most cases simply misinterpreted owing to the general ignorance. The type is preserved for us in those collections of *Formulae*, of which complete and scientific editions have been published by Eugène de Rozière and Carl Zeumer. During this period, too, the Gallican Church adopted the collection of councils and decretals, called later the *Codex canonum ecclesiae Gallicanae*, which she continued to preserve. This collection was that of Dionysius Exiguus, which was sent to Charlemagne in 774 by Pope Adrian I. But in the course of the 9th century apocryphal collections were also formed in the Gallican Church: the *False Capitularies of Beneficium*, the *Debonnaire*, and the *False Decretals of Isidore Mercator* (see DECRETALES).

All the subjects of the Frankish monarchy were not of equal status. There was, strictly speaking, no nobility, both the Roman and the Germanic nobility having died out; but slavery continued to exist. The Church, however, was preparing the transformation of the slave into the serf, by giving force and validity to their marriages, in cases, at least, when the master had approved of them, and by forbidding the latter unjustly to seize the slave's *pecudium*. But between the free man (*ingenius*) and the slave lay a number of persons of intermediate status; they possessed legal personality but were subject to incapacities of various kinds, and had to perform various duties towards other men. There was, to begin with, the Roman colonist (*colonus*), a class as to the origin of which there is still controversy, and of which there is no clear mention in the laws before the 4th century; they and their children after them were attached perpetually to a certain piece of land, which they were allowed to cultivate on payment of a rent. There were, further, the *litus* (*litus or lites*), a similar class of Germanic origin; also the greater number of the freedmen or descendants of freedmen. Many free men who had fled to the great landowners for protection took, by arrangement or by custom, a similar position. Under the Merovingian régime, and especially under the Carolingians, the occupation of the land tended to assume the character of tenures; but free ownership of land continued to exist under the name of *alod* (*alodis*), and there is even evidence for the existence of this in the form of small properties, held by free men; the capitularies contain numerous complaints and threats against the counts, who endeavoured by the abuse of their power to obtain the surrender of these properties.

Period of Anarchy and the Rise of Feudalism.—The 9th and 11th centuries were a period of profound anarchy, during which feudalism was free to develop itself and to take definitive forms. Up to that time the people may be said to have lived without laws, without fixed customs and without government. The legislative power was no longer exercised, for the last Carolingian capitularies date from the year 884, and the first laws of the Capetian kings (if they may be called laws) do not appear till during the 12th century. During this period the old capitularies and *leges* fell into disuse and in their place territorial customs tended to grow up, their main constituents being furnished by the law of former times, but which were at the outset ill-defined and strictly local. As to the government, if the part played by the Church be excepted, we shall see that it could be nothing but the application of brute force. In this anarchy, as always happens under similar conditions, men drew together and formed themselves into groups for mutual defence. A nucleus was formed which was to become the new social unit, that is to say, the feudal group. Of this the centre was a chief, around whom gathered men capable of bearing arms, who commended themselves to
him according to the old form of vassalage, per manus. They owed him fidelity and assistance, the support of their arms but not of their purse, save in quite exceptional cases; while he owed them protection. Some of them lived in his castle or fortified house, receiving their equipment only and eating at his table. Others received lands from him, which were, or later became, fiefs, on which they lived casati. The name fief, feudum, does not appear, however, till towards the end of this period; these lands are frequently called beneficia as before; the term most in use at first, in many parts, is casamentum. The fief, moreover, was generally held for life and did not become generally hereditary till the second half of the 11th century. The lands kept by the chief and those which he granted to his men were for the most part rented from him, or from them, for a certain amount in money or in kind. All these conditions had already existed previously in much the same form; but the new development is that the chief was no longer, as before, merely an intermediary between his men and the royal power. The group had become in effect independent, so organized as to be socially and politically self-sufficient. It constituted a small army, led, naturally, by the chief, and composed of his feudatories, supplemented in case of need by the rustici. It also formed an assembly in which common interests were discussed and the members, according to custom, being bound to support their feudatories and their own chief to the best of their power. It also formed a court of justice, in which the feudatories gave judgment under the presidency of their lord; and all of them claimed to be subject only to the jurisdiction of this tribunal composed of their peers. Generally they also judged the villains (villani) and the serfs dependent on the group, except in cases where the latter obtained as a favour judges of their own status, which was, however, at that time a very rare occurrence.

Under these conditions a nobility was formed, those men becoming nobles who were able to devote themselves to the profession of arms and were either chiefs or soldiers in one of the groups which have just been described. The term designating a noble, miles, corresponds also to that of knight (Fr. chevalier, Low Lat. caballerius), for the reason that chivalry, of which the origins are uncertain, represents essentially the technical skill and professional duties of this military class. Every noble was destined on coming of age to become a knight, and the knight equally as a matter of course received a fief, if he had not one already by hereditary title. This nobility, moreover, was not a caste but could be indefinitely recruited by the granting of fiefs and admission to knighthood (see KNIGHTHOOD AND CASTELLS).

The state of anarchy was by now so far advanced that war became an individual right, and the custom of private war arose. Every man had in principle the right of making war to defend his rights or to avenge his wrongs. Later on, doubtless, in the 13th century, this was a privilege of the noble (gentilhomme); but the texts defining the limits which the Church endeavoured to set to this abuse, namely, the Peace of God and the Truce of God, show that this was at the outset a power possessed by men of all classes. Even a man who had appeared in a court of law and received judgment had the choice of refusing to accept the judgment and of making war instead. Justice, moreover, with its frequent employment of trial by combat, did not essentially differ from private war.

It is unnecessary to go further and to affirm, with certain historians of our time, for example Guilhermoz and Sée, that the only free men at that time, besides the clergy, were the nobles, and all the rest being serfs. There are many indications which lead us to assume not only in the towns but even in the country districts, the existence of a class of men of free status who were not milites, the class later known in the 15th century as vilains, hommes de poeste, and, later, roturiers. The fact more probably was that only the nobles and ecclesiastics were exempt from the exactions of the feudal lords; while from all the others the seigneurs could at pleasure levy the taille (a direct and arbitrary tax), and those innumerables rights then called consuetudines.

Free ownership, the allodium, even under the form of small freeholds, still existed by way of exception in many parts.

Had, then, the main public authority disappeared? This is practically the contention of certain writers, who, like M. Sée, maintain that real property, the possession of a domain, conferred on the big landed proprietor all rights of taxation, command and coercion over the inhabitants of his domain, who, according to this view, were always serfs. But this is an exaggeration of the thesis upheld by old French authors, who saw in feudalism, though in a different sense, a confusion of property with sovereignty. It appears that in this state of political disintegration each part of the country which had a homogeneous character tended to form itself into a higher unit. In this unit there arose a powerful lord. generally a duke, a count, or a viscount, who sometimes came to be called the capitis dominus. He was either a former official of the monarchy, whose function had become hereditary, or a usurer who had formed himself on this model. He laid claim to an authority other than that conferred by the possession of real property. He still claimed to exercise over the whole of his former district certain rights, which we see him sometimes surrendering for the benefit of churches or monasteries. His court of justice was held in the highest honour, and to its own officers was referred to in their own districts. Some of those courts were generally a number of more or less powerful lords, who as a rule had as yet no particular feudal title and are often given the name of principes. Often, but not always, they had commended themselves to this duke or count by doing homage.

On the other hand, the royal power continued to exist, being recognized by a considerable part of old Gaul, the regnum Francorum. But under the last of the Carolingians it had in fact become elective, as is shown by the elections of Odo and Robert before that of Hugh Capet. The electors were the chief lords and prelates of the regnum Francorum. But following a clever policy, each king during his lifetime took as partner of his kingdom his eldest son and consecrated and crowned him in advance, so that the first of the Capetians revived the principle of heredity in favour of the eldest son, while establishing the hereditary indivisibility of the kingdom. This custom was recognized at the accession of Louis the Fat, but the authority of the king was very weak, being merely a vague allegiance. His only real authority lay in his right to the crown and his possession of it; in his district there were generally a number of more or less powerful lords, who as a rule had as yet no particular feudal title and are often given the name of principes. Often, but not always, they had commended themselves to this duke or count by doing homage.

Private war.

The state of anarchy was by now so far advanced that war became an individual right, and the custom of private war arose. Every man had in principle the right of making war to defend his rights or to avenge his wrongs. Later on, doubtless, in the 13th century, this was a privilege of the noble (gentilhomme); but the texts defining the limits which the Church endeavoured to set to this abuse, namely, the Peace of God and the Truce of God, show that this was at the outset a power possessed by men of all classes. Even a man who had appeared in a court of law and received judgment had the choice of refusing to accept the judgment and of making war instead. Justice, moreover, with its frequent employment of trial by combat, did not essentially differ from private war.

The Church.
INSTITUTIONS

FRANCE

ecclesiastical or Christian courts (cours d'église, cours de chrétienneté). The Church, moreover, remained in close connection with the crown, the king preserving a quasi-ecclesiastical character, while the royal prerogatives with regard to the election of bishops were maintained more successfully than the rights of the crown, though in many of the great fiefs they none the less passed to the count or the duke. It was at this time too that the Church tried to break the last ties which still kept her more or less dependent on the civil power; this was the true import of the Investiture Contest (see INVESTITURE, and CHURCH HISTORY), though this was not very acute in France.

The period of the true feudal monarchy is embraced by the 12th and 13th centuries, that is to say, it was at this time that the crown again assumed real strength and authority; but so far it had no organs and instruments save those which were furnished by feudalism, now organized under a regular hierarchy, of which the king was the head, the "sovereign enfeoffee of the kingdom" (souverain feffue du royaume), as he came later on to be called. This new position of affairs was the result of three great factors: the revival of Roman law, the final organization of feudalism and the rise of the privileged towns. The revival of Roman law began in France and Italy in the second half of the 11th century, developing with extraordinary brilliancy in the latter country at the university of Bologna, which was destined for a long time to dominate Europe. Roman law spread rapidly in the French schools and universities, except that of Paris, which was closed to it by the papacy; and the influence of this study was so great that it transformed society. On the one hand it contributed largely to the reconstitution of the royal power, modelling the rights of the king on those of the Roman emperor. On the other hand it wrought a no less profound change in private law. From this time dates the division of old France into the Pays de droit écrit, in which Roman law, under the form in which it was codified by Justinian, was received as the ordinary law; and the Pays de coutume, where it played only a secondary part, being generally valid only as ratio scripta and not as lex scripta. In this period the customs also took definitive form, and over and above the local customs properly so called there were formed customs known as general, which held good throughout a whole province or bailliage, and were based on the jurisprudence of the higher jurisdictions.

The final organization of feudalism resulted from the struggle for organization which was proceeding in each district where the more powerful lords compelled the others to do them homage and become their vassals; the capite dominus had beneath him a whole hierarchy, and was himself a part of the feudal system of France (see FEUDALISM). Doubtless in the case of lords like the dukes of Brittany and Burgundy, the king could not actually demand the strict fulfilment of the feudal obligations; but the principle was established. The question now arises, did free and absolute property, the alodium, entirely disappear in this process, and were all lands held as tenures? It continued to exist, by way of exception, in most districts, unchanged save in the burden of proof of ownership, with which, according to the custom, sometimes the lord and sometimes the holder of the land was held charged. In the respect, however, namely in the administration of justice, the feudal hierarchy had absolute sway. Towards the end of the 13th century Beaumanoir clearly laid down this principle: "All secular jurisdiction in France is held from the king as a fief or an arrière-fief." Henceforth it could also be said that "All justice emanates from the king." The law concerning fiefs became settled also from another point of view, the fief becoming patrimonial; that is to say, not only hereditary, but freely alienable by the vassal, subject in both cases to certain rights of transfer due to the lord, which were at first fixed by agreement and later by custom. The most salient features of feudal succession were the right of primogeniture, which had at first involved the total exclusion of the younger members of a family, tended to be modified, except in the case of the chief lords, to the eldest son obtaining the preponderant share or preceptif. Non-noble (posterier) tenancies also became patrimonial in similar circumstances, except that in their case there was no right of primogeniture nor any privilege of males. The tenure of serfs did not become alienable, and only became hereditary by certain devices.

Feudal society next saw the rise of a new element within it: the privileged towns. At this time many towns acquired privileges, the movement beginning towards the end of the 11th century; they were sanctioned by a formal concession from the lord to whom the town was subject, the concession being embodied in a charter or in a record of customs (coutume). Some towns won for themselves true political rights, for instance the right of self-administration, rights of justice over the inhabitants, the right of not being taxed except by their own consent, of maintaining an armed force, and of controlling it themselves. Others only obtained civil rights, e.g. guarantees against the arbitrary rights of justice and taxation of the lord or his provost. The chief forms of municipal organization at this time were the commune jurée of the north and east, and the consulat, which came from Italy and penetrated as far as Auvergne and Limousin. The towns with important privileges formed in feudal society as it were a new class of lordships; but their lords, that is to say their burgesses, were inspired by quite a new spirit. The crown courted their support, taking them under its protection, and championing the causes in which they were interested (see COMMUNE). Finally, it is in this period, under Philip Augustus, that the great fiefs began to be effectually reannexed to the crown, a process which, continued by the kings up to the end of the ancien régime, refounded for their profit the territorial sovereignty of France.

The crown maintained the machinery of feudalism, the chief central instruments of which were the great officers of the crown, the senechal, butler, constable and chancellor, who were to become irremovable officials, those at least who survived. But this period saw the rise of a special college of dignitaries, that of the Twelve Peers of France, consisting of six laymen and six ecclesiastics, which took definitive shape at the beginning of the 13th century. We cannot yet discern with any certainty by what process it was formed, why those six prelates and those six great feudatories in particular were selected rather than others equally eligible. But there is no doubt that we have here a result of that process of feudal organization mentioned above; the formation of a similar assembly of twelve peers occurs also in a certain number of the great fiefs. Besides the part which they played at the consecration of kings, the peers of France formed a court in which they judged one another under the presidency of the king, their overlord, according to feudal custom. But the cour des pairs in this sense was not separate from the curia regis, and later from the parlement of Paris, of which the peers of France were by right members. From this time, too, dates another important institution, that of the matières des royautes.

The legislative power of the crown again began to be exercised during the 12th century, and in the 13th century had full authority over all the territories subject to the crown. Beaumanoir has a very interesting theory on this subject. The right of war tends to regain its natural equilibrium, the royal power following the Church in the endeavour to check private wars. Hence arose the quarantaine le roi, due to Philip Augustus or Saint Louis, by which those relatives of the parties to a quarrel who had not been present at the quarrel were rendered immune from attack for forty days after it; and above all the assises imposed by the king or lord; on these points too Beaumanoir has an interesting theory.

The rule was, moreover, already in force by which private wars had to cease during the time that the king was engaged in a foreign war. But the most appreciable progress took place in the

the countship of Artois to the rank of peerages of France. This really amounted to changing the nature of the institution for the new heirs held their rank merely at the king’s will, though the rank continued to belong to a great barony and to be held down with it. Before long peers began to be created where there were no gaps in the ranks of the College, and there was a constant increase in the numbers of the lay peers. At the beginning of the 14th century appeared the states general (états généraux), which were often convoked, though not at fixed intervals, throughout the whole of the 14th century and the greater part of the 15th. Their power reached its height at a critical moment of the Hundred Years’ War during the reign of King John. At the same time there arose side by side with them, and from the same causes, the provincial estates, which were in miniature for each province what the states general were for the whole kingdom. Of these provincial assemblies some were found in one or other of the great fiefs, being convoked by the duke or count under the pressure of the same needs which led the king to convok the states general; others, in provinces which had already been annexed to the crown, probably had their origin in the councils summoned by the baillis or seneschals to aid him in his administration, for no time was lost in constituting a provincial assembly. Those which did so were never of right subject to the royal taille, and kept, at least formally, the right of sanctioning, by means of the assembly, the subsidies which took its place. Hence it became the endeavour of the crown to suppress these provincial assemblies, which in the 14th century were to be found everywhere; from the outset of the 15th century they began to disappear in central France. The most characteristic feature of this period was the institution of universal taxation by the crown. So far the king’s sole revenues were those which he exacted, in his capacity of feudal lord, wherever another lord did not intervene between him and the inhabitants, in addition to the income arising from certain crown rights which he had preserved or regained. But these revenues, known later as the income of the royal domain and later still as the finances ordinaires, became insufficient in proportion as the royal power increased; it became a necessity for the monarch to be able to levy imposts throughout the whole extent of the provinces annexed to the crown, instead of the subjects being levied for a provincial assembly; those which did so were never of right subject to the royal taille, and kept, at least formally, the right of sanctioning, by means of the assembly, the subsidies which took its place. Hence it became the endeavour of the crown to suppress these provincial assemblies, which in the 14th century were to be found everywhere; from the outset of the 15th century they began to disappear in central France.

The army. The army also was organized. On the one hand, the military service attached to the fiefs was transformed for the profit of the king, who alone had the right of making war. It became the arrière-ban, a term which had formerly been applied to the levée en masse of all the inhabitants in times of national danger. Before the 14th century the king had only had the power of calling upon his own immediate vassals for service. Henceforth all possessors of fiefs owed him, whether within the kingdom or on the frontiers, military service without pay and at their own expense. This was for long an important resource for the king. But Charles VII. organized an army on a larger scale and laboriously manned it. It was composed of regiments, for a large part of which the crown was to provide, but in time of peace had to practise archery, and companies of gendarmerie or heavy cavalry, forming a permanent establishment, which were called compagnies d’ordonnance. It was chiefly to provide for the expense of the first nucleus of a permanent army that the taille itself had been made permanent. The new army led to the institution of the governors of provinces, who were to command the troops quartered there. At first they were only appointed for the frontiers and fortified places, but later the kingdom was divided into gouvernements généraux. There were at first twelve of these, which were called in the middle of the 16th century the douze anciens gouvernements. Although, strictly speaking, they had only military powers, the governors, always chosen among the great lords, became in the provinces the direct representatives of the king and caused the baillis and seneschals to take a secondary place.

The courts of law continued to develop on the lines already laid down. The parlement, which had come to be a judicial court, was nominated every year, but always consisting in the same persons, and in the course of the 14th century into a body of magistrates who were permanent but as yet subject to removal. During this period were evolved its organization and definite features (see PARLEMENT). The provincial parlements had arisen after and in imitation of that of Paris, and had for the most part taken the place of some superior jurisdiction which had formerly existed in the same district when it had been independent (like Provence) or had formed one of the great fiefs (like Normandy or Burgundy). It was during this period also that the parlements acquired the right of opposing the registration, that is to say, the promulgation...
of laws, of revising them, and of making representations (remontrance) to the king when they refused the registration, giving the reasons for such refusal. The other royal jurisdictions were completed (see BAILLEN, CHÂTELET). Besides them arose another of great importance, which was of military origin, but came to include all citizens under its sway. These were the provosts of the marshals of France (prévôts des marcheaux de France), who were officers of the Marcheau (the gendarmerie of the time); they exercised criminal jurisdiction without appeal in the case of crimes committed by vagabonds and fugitives from justice, this class being called their giber (game), and of a number of crimes of violence, whatever the rank of the offender. Further, another class of officers was created in connexion with the law courts: the "king's men" (gens du roi), the procureurs and avocats du roi, who were at first simply those lawyers who represented the king in the law courts, or pleaded for him when he had some interest to follow up or to defend. Later they became officers of the crown. In the case of the procureurs du roi this development took place in the first half of the 14th century. Their duty was not only to represent the king in the law courts, whether as plaintiff or defendant; but they had also to represent the king in the legislative chambers, when the law was applied, and to demand its application. From this time on the procureurs du roi had full control over matters concerning the public interest, and especially over public prosecution. In this period, too, appeared what was afterwards called justice retenue, that is to say, the justice which the king administered, or was supposed to administer, in person. It was based on the idea that, since all justice and all judicial power reside in the king, he could not deprive himself of them by delegating their exercise to his officers and to the feudal lords. Consequently he could, if he thought fit, take the place of the judges and call up a case before his own council. He could reverse even the decisions of the courts of final appeal, and in some cases used this means of appealing against the decrees of the parlements (proposition d'erreur, requête civile, pourvoi en révision). In these cases the king was supposed to judge in person; in reality they were examined by the maîtres des requêtes and submitted to the royal council (conseil du roi), at which the king was always supposed to be present and which had in itself no power of giving a decision. For this purpose there was soon formed a special committee of the council, which was called the conseil privé or de justice. At the end of the 15th century, Charles VIII., in order to relieve the council of some of its functions, created a new final court, the grand conseil, to deal with a number of these cases. But before long it again became the custom to appeal to the conseil du roi, so that the grand conseil became almost useless. The king frequently, by means of lettres de justice, intervened in the procedure of the courts, by granting bénéfices, by which rules which were too severe were modified, and faculties or faculties for overcoming difficulties arising from flaws in contracts or judgments, cases at that time not covered by the common law. By lettres de grâce he granted reprieve or pardon in individual cases. The most extreme form of intervention by the king was made by means of lettres de cachet (q.v.), which ordered a subject to go without trial into a state prison or into exile. The condition of the Church changed greatly during this period. The jurisdiction of the officialité was very much reduced, even over the clergy. They ceased to be competent to judge actions concerning the possession of real property, in which the clergy were defendants. In criminal law the theory of the cas privilégié, which appears in the 14th century, enabled the royal judges to take action against and judge the clergy for all serious crimes, though without the power of inflicting any penalties but arbitrary fines, the ecclesiastical judge remaining competent, in accordance with the privileges of clergy, to try the offender for the same crime as what was technically called a délit commun. The development of jurisprudence gradually removed from the officialités causes of a purely secular character in which laymen only were concerned, such as wills and contracts; and in matrimonial cases their jurisdiction was limited to those in which the foedus matrimonii was in question. For the acquisition of real property by ecclesiastical establishments the consent of the king to the amortizement was always necessary, even in the case of alodial lands; and if it was a case of feudal tenures the king and the direct overlords alone kept their rights, the intermediate lords being left out of the question.

As regards the conferring of ecclesiastical benefices, from the 14th century onwards the papacy encroached more and more upon the rights of the bishops, in whose gift the inferior benefices generally were, and of the electors, who usually conferred the superior benefices; at the same time it exacted from newly appointed incumbents heavy dues, which were included under the generic name of annates (q.v.). During the Great Schism of the Western Church, these abuses became more and more crying, until by a series of edicts, promulgated with the consent and advice of the parlement and the clergy, the Gallican Church was restored to the possession of its former liberties, under the royal authority. Thus France was ready to accept the decrees of reform issued by the council of Basel (q.v.), which she did, with a few modifications, in the 15th century. The Pragmatic Sanction of the clergy and nobles at Bourges and registered by the parlement of Paris in 1438. It suppressed the annates and most of the means by which the popes disposed of the inferior benefices: the reservations and the gratiae expectationis. For the choice of bishops and abbots, it restored election by the chapters and convents. The Pragmatic Sanction, however, was never recognized by the papacy, nor was it consistently and strictly applied by the royal power. The transformation of the civil and criminal law under the influence of Roman and canon law had become more and more marked. The production of the coutumiers, or livres de pratiques, also continued. The chief of them were: in the 14th century, the Stylus Vetus Curiae Parlia- menti of Guillaume de Brevi; the Très ancienne coutume de Béarn; the Grand Coutumier de France, or Coutumier de Charles VI.; the Somme rural of Boutillier; in the 15th century, for Auvergne, the Practica forensis of Masuer. Charles VII., in an article of the Grand Orleans of Montil-les-Tours (1453), ordered the general customs to be officially recorded under the supervision of the crown. It was an enormous work, which would almost have transformed them into written laws; but up to the 16th century little recording was done, the procedure established by the Ordonnance for the purpose not being very suitable.

The Absolute Monarchy.—From the 16th century to the Revolution was the period of the absolute monarchy, but it can be further divided into two periods: that of the establishment of this régime, from 1515 to about 1673; and that of the ancien régime when definitively established, from 1673 to 1780. The reigns of Francis I. and Henry II. clearly laid down the principle of the absolute power of the crown and applied it effectually, as is plainly seen from the temporary disappearance of the states general, which were not assembled under these two reigns. There were merely a few assemblies of notables chosen by the royal power, the most important of which was that of Cognac, under Francis I., summoned to advise on the non-fulfilment of the treaty of Madrid. It is true that in the second half of the 16th century the states general reappeared. They were summoned in 1560 at Orleans, then in 1561 at Pontoise, and in 1576 and 1588 at Blois. The League even convoked one, which was held at Paris in 1593. This represented a crucial and final struggle. Two points were then at issue: firstly, whether France was to be Protestant or Catholic; secondly, whether she was to have a limited or an absolute monarchy. The two problems were not necessarily bound up with one another. For if the Protestants desired political liberty, many of the Catholics wished for it too, as is proved by the writings of the time, and even by the fact that the League summoned the estates. But the states general of the 16th century, in spite of their good intentions and the great talents which were at their service, were dominated by religious passions, which made them powerless...
for any practical purpose. They only produced a few great ordinances of reform, which were not well observed. They were, however, to be called together yet again, as a result of the disturbances which followed the death of Henry IV.; but their dissensions and powerlessness were again strikingly exemplified and they did not reappear until 1789. Other bodies, however, which the royal power had created, were to carry on the struggle against it. There were the parlements, the political rivals of the states general. Thanks to the principle according to which no law came into effect so long as it had not been registered by them, they had, as we have seen, won for themselves the right of a preliminary discussion of those laws which were presented to them, and of refusing registration, explaining their reasons to the king by means of the remonstrances. The royal power saw in this merely a concession from itself, a consultative power, which ought to yield before the royal will, when the latter was clearly manifested, either by lettres de fustion or by the actual words and presence of the king, when he came in person to procure the registration of a law in a so-called lit de justice. But from the 16th century onwards the members of the parlements, claiming on the strength of a historical theory, to have inherited the powers of the ancient assemblies (the Merovingian and Carolingian placita and the curia regis), powers which they, moreover, greatly exaggerated. The successful assertion of this claim would have made them at once independent of and necessary to the crown. During the minority of kings, they had possessed, in fact, special opportunities for asserting their pretensions, particularly when they had been called upon to intervene in the organization of the regency. It is on this account that at the beginning of the reign of Louis XIV. the parlement of Paris wished to take part in the government, and in 1648, in concert with the other supreme courts of the capital, temporarily imposed a sort of charter of liberties. But the first Fronde, of which the parlement was the centre and soul, led to its downfall, which was completed when later on Louis XIV. became all-powerful. The ordinance of 1667 on civil procedure, and above all a declaration of 1673, ordered the parlement to register the laws as soon as it received them and without any modification. It was only after this registration that they were allowed to draw up remonstrances, which were henceforth futile. The nobles, as a body, had also become politically impotent. They had been sorely tried by the wars of religion, and Richelieu, in his struggles against the governors of the provinces, had crushed their chief leaders. The second Fronde was their last effort (see FRONDE). At the same time the central government underwent changes. The great officers of the crown disappeared one by one. The office of constable of France was suppressed by purchase during the first half of the 17th century, and of those in the first rank only the chancellor survived till the Revolution. But though his title could only be taken from him by condemnation on a capital charge, the king was able to deprive him of his functions by taking from him the custody and use of the seal of France, which were entrusted to a garde des sceaux. Apart from the latter, the king's real ministers were the secretaries of state, generally four in number, who were always of noble birth and were not chosen from the great nobles. For purposes of internal administration, the provinces were divided among them, each of them corresponding by despatches with those which were assigned to him. Any other business (with the exception of legal affairs, which belonged to the chancellor, and finance, of which we shall speak later) was divided among them according to convenience. At the end of the 16th century, however, were evolved two regular departments, those of war and foreign affairs. Under Francis I. and Henry II., the chief administration of finance underwent a change; for the four généraux des finances, who had become too powerful, were substituted the intendants des finances, one of whom soon became a chief minister of finance, with the title surintendant. The généraux des finances, like the trésoriers de France, became provincial officials, each at the head of a généralité (a superior administrative district for purposes of finance); under Henry III. the two functions were combined and assigned to the bureaux des finances. The fall of Fouquet led to the suppression of the office of surintendant; but soon Colbert again became practically a minister of finance, under the name of contrôleur général des finances, both title and office continuing to exist up to the Revolution.

The conseil du roi, the origin of which we have described, was an important organ of the central government, and for a long time included among its members a large number of representatives of the nobility and clergy. Besides the councillors of state (conseillers d'état), its ordinary members, the great officers of the crown and secretaries of state, princes of the blood and peers of France were members of it by right. Further, the king was accustomed to grant the brevet of councillor to a great number of the nobility and clergy, who could be called upon to sit in the council and give an opinion on matters of importance. But in the 17th century the council tended to differentiate its functions, forming three principal sections, one for political, one for financial, and the third for legal affairs. Under Louis XIV. it took a definitely professional, administrative and technical character. The conseillers d'etat were all suppressed in 1673, and the peers of France ceased to be members of the council. The political council, or conseil d'en haut, had no ex officio members, not even the chancellor; the secretary of state for foreign affairs, however, necessarily had entry to it; it also included a small number of persons chosen by the king and bearing the title of ministers of state (ministres d'état). The other important sections of the conseil du roi were the conseil des finances, organized after the fall of Fouquet, and the conseil des dépôches, in which sat the four secretaries of state and where everything concerned with internal administration (except finance) was dealt with, including the legal business connected with this administration. As to the government and the preparation of laws, under Louis XIV. and Louis XV., the conseil du roi often passed into the background, when, as the saying went, a minister who was projecting some important measure travaillait seul avec le roi (worked alone with the king), having from the outset gained the king's ear. The chief authority in the provincial administration belonged in the 16th century to the governors of the provinces, though, strictly speaking, the governor had only military powers in his gouvernement; for, as we have seen, he was the direct representative of the king for general purposes. But at the end of this century were created the intendants of the provinces, who, after a period of conflict with the governors and the parlements, became absolute masters of the administration in all those provinces which had no provincial estates, and the instruments of a complete administrative centralization (see INTENDANT). The towns having a corps de ville, that is to say, a municipal organization, preserved in the 16th century a fairly wide autonomy, and played an important part in the wars of religion, especially under the League. But under Louis XIV. their independence rapidly declined. They were placed under the tutelage of the intendants, whose sanction, or that of the conseil du roi, was necessary for all acts of any importance. In the closing years of the 17th century, the municipal officials ceased, even in principle, to be elective. Their functions ranked as offices which were, like royal offices, saleable and heritable. The pretext given by the edicts were the intrigues and dissensions caused by the elections; the real cause was that the government wanted to sell these offices, which is proved by the fact that it frequently allowed towns to redeem them and to re-establish the elections. The sale of royal offices is one of the characteristic features of the ancien régime. It had begun early, and, apparently, with the office of councillor of the parlement of Paris, when this became permanent, in the second half of the 14th century. It was first practised by magistrates who wished to dispose of their office in favour of a successor of their own choice. The resignation in favorem of ecclesiastical benefices served as model, and at first care was taken to conceal the money transaction between the parties. The crown winked at these resignations in consideration of a payment in money.
But in the 16th century, under Francis I. at the latest, the crown itself began officially to sell offices, whether newly created or vacant by the death of their occupiers, taking a fee from those upon whom they were conferred. Under Charles IX. the right of resigning in favorum was recognized by law in the case of royal officials, in return for a payment to the treasury of a certain proportion of the price. In the case of judicial offices there was a struggle for at least two centuries between the system of sale and another, also imitated from canon law, i.e., the election or presentation of candidates by the legal corporations. The ordinances of the second half of the 16th century, granted in answer to complaints of the states general, restored and confirmed the latter system, giving a share in the presentation to the towns or provincial notables and forbidding sales. The system of sale, however, triumphed in the end, and, in the case of judges, had, moreover, a favourable result, assuring to them that irremovability which Louis XI. had promised in vain; for, under this system, the king could not reasonably dismiss an official arbitrarily without refunding the fee which he had paid. On the other hand, it contributed to the development of the épices, or dues paid by litigants to the judge. The system of sale and with it irremovability, was extended to all official functions, even to financial posts. The process was completed by the recognition of the rights in the sale of offices as hereditary, i.e., the right of resigning the office on payment of a fee, either in favour of a competent descendant or of a third party, passed to the heirs of an official who had died without having exercised this right himself. It was established under Henry IV. in 1604 by the system called the Poulette, in return for the payment by the official of an annual fee (droit annuel) which was definitely fixed at a hundredth part of the price of the office. Thus these offices, though the royal nomination was still required as well as the professional qualifications required by the law, became heritable property in virtue of the finance attached to them. This led to the formation of a class of men who, though bound in many ways to the crown, were actually independent. Hence the tendency in the 18th century to create new and important functions under the form, not of offices, but of simple commissions.

In this period of the history of France were evolved and defined the essential principles of the old public law. There were, in the first place, the fundamental laws of the realm, which were true constitutional principles, established for the most part not by law but by custom, and considered as binding in respect of the king himself; so that, although he was sovereign, he could neither abrogate, nor modify, nor violate them. There was, however, some discussion as to what rules actually came under this category, except in the case of two series about which there was no doubt. These were, on the one hand, those which dealt with the succession to the crown and forbade the king to change its order, and those which proclaimed the inalienability of the royal domain, against which no title by prescription was valid. This last principle, introduced in the 14th century, had been laid down and defined by the edict of Moulins in 1266; it admitted only two exceptions: the formation of appanages (q.v.), and selling (engagement), to meet the necessities of war, with a perpetual option of redeeming it.

There was in the second place the theory of the rights, franchises and liberties of the Gallican Church, formed of elements some of which were of great antiquity, and based on the conditions which had determined the relations of the Gallican Church with the crown and papacy during the Great Schism and under the Pragmatic Sanction of Bourges, and defined at the end of the 16th and the beginning of the 17th century. This body of doctrine was defined by the writings of three men especially, Guy Coquille, Pierre Pithou and Pierre Dupuy, and was solemnly confirmed by the declaration of the clergy of France, or Déclaration des quatre articles of 1682, and by the edict which promulgated it. Its substance was based chiefly on three principles: firstly, that the temporal power was absolutely independent of the spiritual power; secondly, that the pope had authority over the clergy of France in temporal matters and matters of discipline only by the consent of the king; thirdly, that the king had authority over and could legislate for the Gallican Church in temporal matters and matters of discipline. The old public law provided a safeguard against the violation of these rules. This was the process known as the appel comme d'abus, formed of various elements, some of them very ancient, and definitely established during the 16th century. It was heard before the parlements, but could, like every other case, be evoked before the royal council. Its effect was to annul any act of the ecclesiastical authority due to abuse or contrary to French law. The clergy were, when necessary, reduced to obedience by means of arbitrary fines and by the seizure of their temporalities. The Pragmatic Sanction had been abrogated and replaced by the Concordat of 1515, concluded between Francis I. and Leo X., which remained in force until suppressed by the Constituent Assembly. The Concordat, moreover, preserved many of the enactments of the Pragmatic Sanction, notably those which protected the collation of the inferior benefices from the encroachments of the papacy, and which had introduced reforms in certain points of discipline. But in the case of the superior benefices (bishops and abbeys) election by the chapters was suppressed. The king of France nominated the candidate, to whom the pope gave canonical institution. As a matter of fact, the pope had no choice; he had to institute the nominee of the king, unless he could show his un worthiness or incapacity, as the result of inquiries regularly conducted in France; for the pope it was, as the ancient French authors used to say, a case of compulsory collation. The annates were re-established at the time of the Concordat, but considerably diminished in comparison with what they had been before the Pragmatic Sanction. We must add, to complete this account, that many of the inferior benefices, in France as in the rest of Christendom, were conferred according to the rules of patronage, the patron, whether lay or ecclesiastic, presenting a candidate whom the bishop was bound to appoint, provided he was neither incapable nor unsuitable. There was some difficulty in getting the Concordat registered by the parlement of Paris and the latter even announced its intention of not taking the Concordat into account in those cases concerning benefices which might come before it. The crown found an easy method of making this opposition ineffectual, namely, to transfer to the Grand Conseil the decision of cases arising out of the application of the Concordat.

In the 16th century also, contributions to the public services drawn from the immense possessions of the clergy were regularized. Since the second half of the 12th century at least, the kings had in times of urgent need asked for subsidies from the church, and ever since the Saladin tithe (dime saladin) of Philip Augustus this contribution had assumed the form of a tithe, taking a tenth part of the revenue of the benefices for a given period. Tithes of this kind were fairly frequently granted by the clergy of France, either with the pope's consent or without (this being a disputed point). After the Concordat, Leo X., granted the king a tithe (décime) under the pretext of a projected war against the Turks; hitherto concessions of this kind had been made by the papacy in view of the Crusades or of wars against heretics. The concession was several times renewed, until, by force of custom, the levying of these tithes became permanent. But in the middle of the 16th century the system changed. The crown was heavily in debt, and its needs had increased. The property of the clergy having been threatened by the states general of 1560 and 1561, the king proposed to them to remit the bulk of the tithes and other dues, in return for the payment by them of a sum equivalent to the proceeds of the taxes which he had mortgaged. A formal contract to this effect was concluded at Poissy in 1561 between the king and the clergy of France, represented by the prelates who were then gathered together for the Colloquy of Poissy with the Protestants, and some of those who had been sitting at the states general of Pontoise. The fulfilment of this agreement was, however, evaded by the king, who diverted part of the funds provided by the clergy from their proper purpose. In 1568,
after a period of ten years which had been agreed on, a new assembly of the clergy was called together and, after protesting against this action, renewed the agreement, which was henceforward always renewed every ten years. Such was the definitive form of the contribution of the clergy, who also acquired the right of themselves assessing and levying these taxes on the holders of benefices. Thus every ten years there was a great assembly of the clergy, the members of which were elected. There were two stages in the election, a preliminary one in the dioceses and a further election in the ecclesiastical provinces, each province sending four deputies to the general assembly, two of the first rank, that is to say, chosen from the episcopate, and two of the second rank, which included all the other clergy. The dons gratuits (benevolences) voted by the assembly comprised a fixed sum equivalent to the old tithes and supplementary sums paid on one occasion only, which were sometimes considerable. The church, on her side, profited by this arrangement in order to obtain the commutation or redemption of the taxes affecting ecclesiastics considered as individuals. This settlement only applied to the “clergy of France,” that is to say, to the clergy of those districts which were united to the crown before the end of the 16th century. The provinces annexed later, called pays étrangers, or pays conquis, had in this matter, as in many others, an arrangement of their own. At last, under Louis XV. the edict of 1749, concernant les établissements et acquisitions des gens de mainmorte, was completely effective in subordinating the acquisition of property by ecclesiastical establishments to the consent and control of the crown, rendering them incapable of acquiring real property by bequests.

At the end of the 16th century a wise law had been made which, in spite of the traces which it bore of past struggles, had established a reasonable balance among the Christians of France. The edict of Nantes, in 1598, granted the Protestants full civil rights, liberty of conscience and public worship in many places, and notably in all the royal bailiages. The Catholic whose religion (or, at least, his state religion, which he had never accepted this arrangement as final, and at last, in 1685, under Louis XIV., the edict of Nantes was revoked and the Protestant pastors expelled from France. Their followers were forbidden to leave the country, but many succeeded nevertheless in escaping abroad. The position of those who remained behind was peculiar. Laws passed in 1715 and 1724 established the legal theory that there were no longer any Protestants in France, but only vieux catholiques and nouveaux convertis. The result was that henceforth they had no longer any regular civil status, the registers containing the lists of Catholics enjoying civil rights being kept by the Catholic clergy.

The form of government established under Louis XIV. was preserved without any fundamental modification under Louis XV. After the death of Louis XIV., however, the regent, under the inspiration of the duc de St Simon, made trial of a system of the latter, which made a study while in a close correspondence with the duke of Burgundy. It consisted in substituting for the authority of the ministers, secretaries of state and controller-general councils, or governmental bodies, mainly composed of great lords and prelates. These only lasted for a few years, when a return was made to the former organization. The parlements had regained their ancient rights in consequence of the parlement of Paris having, in 1715, set aside the will of Louis XIV. as being contrary to the fundamental laws of the kingdom, in that it laid down rules for the composition of the council of regency, and limited the power of the regent. This newly revived power they exercised freely, and all the more so since they were the last surviving check on the royal authority. During this reign there were numerous conflicts between them and the government, the causes of this being primarily the innumerable incidents to which the bull Uxigenius gave rise, and the increase of taxes and prohibitions against Jesuits also figure conspicuously in the actions of the parlements. They became at this period the avowed representatives of the nation; they contested the validity of the registration of laws in the lité de justice, asserting that laws could only be made obligatory when the registration had been freely endorsed by themselves. Before the registration of edicts concerning taxation they demanded a statement of the financial situation and the right of examining the accounts. Finally, by the theory of the classes, which considered the various parlements of France as parts of one and the same body, they established among them a political union. These pretensions the crown refused to recognize. Louis XV. solemnly condemned them in a lettre de justice of December 1770, and in 1771 the chancellor Maupou took drastic measures against them. The magistrates of the parlement of Paris were removed, and a new parlement was constituted, including the members of the grand conseil, which had also been abolished. The cour des aides of Paris, which had made common cause with the parlement, was also suppressed. Many of the provincial parlements were reorganized, and a certain number of useful reforms were carried out in the jurisdiction of the parlement of Paris; the object of these, however, was in most cases that of diminishing its importance. These actions, the cour d'état of the chancellor Maupou, as they were called, produced an immense sensation. The repeated conflicts of the reign of Louis XV. had already given rise to a whole literature of books, pamphlets and tracts in which the rights of the crown were discussed. At the same time the political philosophy of the 18th century was disseminating new principles, and especially those of the supremacy of the people and the differentiation of powers, the government of England also became known among the French. Thus men's minds were being prepared for the Revolution.

The personal government of Louis XVI. from 1774 to 1789 was chiefly marked by two series of facts. Firstly, there was the partial application of the principles propounded by the French economists of this period, the Physiocrats, who had a political doctrine peculiar to themselves. They were not in favour of political liberty, but attached, on the contrary to the absolute monarchy, of which they did not fear the abuses because they were convinced that so soon as they should be known, reason (evidence) alone would be sufficient to the crown respect the “natural and essential laws of bodies politic” (Lois naturelles et essentielles des sociétés politiques, the title of a book by Mercier de La Rivière). On the other hand, they favoured civil and economic liberty. They wished, in particular, to decentralize the administration and restore to the landed proprietors the administration and levying of taxes, which they wished to reduce to a tax on land only. This school came into power with Turgot, who was appointed controller-general of the finances, and laid the foundations of many reforms. He actually accomplished for the moment one very important reform, namely, the suppression of the trade and craft gilds (communautes, jurandes et matières). This organization, which was common to the whole of Europe (see Guilds), had taken definitive shape in France in the 13th and 14th centuries, but had subsequently been much abused. Turgot suppressed the gilds of the masters, who alone had been able to work on their own account, or to open shops and workshops, and thus proclaimed the freedom of labour, industry and commerce. However, the old organization, slightly amended, was restored under his successor Necker. It was Turgot’s purpose to organize provincial and other inferior assemblies, whose chief business was to be the assessment of taxes. Necker applied this idea, partially and experimentally, by creating a few of these provincial assemblies in various généralités of the pays d’élections. A general reform on these lines and on a very liberal basis was proposed by Calonne to the assembly of notables in 1787, and it was brought into force for all the pays d’élections, though not under such good conditions, by an edict of the same year. Louis XVI. had inaugurated his reign by the restoration of the parlements; all the bodies which had been suppressed by Maupou and all the officials whom he had dismissed were restored, and all the bodies and officials created by him were suppressed. But it was not long before the old struggle between the crown and parlements again broke out. It began by the conservative opposition offered by the parlement of Paris to Turgot’s reforms. But the real struggle broke out in 1787.
over the edicts coming from the assembly of notables, and particularly over the two new taxes, the stamp duty and the lands tax. The parliament of Paris refused to register them, asserting that the consent of the taxpayers, as represented by the states general, was necessary to fresh taxation. The struggle seemed to have come to an end in September; but in the following November it again broke out, in spite of the king's promise to summon the states general. It reached its height in May 1788, when the king had created a cour plénière distinct from the parlements, the chief function of which was to register the laws in their stead. A widespread agitation arose, amounting to actual anarchy, and was only ended by the recall of Necker to power and the promise to invoke the states general for 1789.

Various Institutions.—The permanent army which, as has been stated above, was first established under Charles VII., was developed and organized during the ancien régime. The gendarmerie or heavy cavalry was continuously increased in numbers. On the other hand, the francs archers fell into disuse under Louis XI.; and, after a fruitless attempt had been made under Francis I. to establish a national infantry, the system was adopted for this also of recruiting permanent bodies of mercenaries by voluntary enlistment. First there were the "old bands" (vieilles bandes), chiefly those of Picardy and Piedmont, and at the end of the 16th century appeared the first regiments, the number of which was from time to time increased. There were also, in the service and pay of the king French and foreign regiments and the latter principally Swiss, Germans and Scots. The system of purchase penetrated also to the army. Each regiment was the property of a great lord; the captain was, so to speak, owner of his company, or rather a contractor, who, in return for the sums paid him by the king, recruited his men and gave them their uniform, arms and equipment. In the second half of the reign of Louis XIV. appeared the militia (milices). To force each parish had to furnish one recruit, who was at first chosen by the assembly of the inhabitants, later by drawing lots among the bachelors or widowers without children, who were not exempt. The militia was very rarely raised from the towns. The purpose for which these men were employed varied from time to time. Sometimes, as under Louis XIV., they were formed into special active regiments. Under Louis XV. and Louis XVI. they were formed into régiments provinciaux, which constituted an organized reserve. But their chief use was during war, when they were individually incorporated into various regiments to fill up the gaps.

Under Louis XV., with the due de Choiseul as minister of war, great and useful reforms were effected in the army. Choiseul suppressed what he called the "arming of companies" (compagnie-ferme); recruiting became a function of the state, and voluntary enlistment a contract between the recruit and the state. Arms, uniform and equipment were furnished by the king. Choiseul also equalized the numbers of the military units, and his reforms, together with a few others effected under Louis XVI., produced the army which fought the first campaigns of the Revolution.

One of the most distinctive features of the ancien régime was excessive taxation. The taxes imposed by the king were numerous, and, moreover, hardly any of them fell on all parts of the kingdom. To this territorial inequality was added the inequality arising from privileges. Ecclesiastics, nobles, and many of the crown officials were exempted from the heaviest imposts. The chief taxes were the taille (g.v.), the aides and the gabelle (g.v.), or monopoly of salt, the consumption of which was generally made compulsory up to the amount determined by regulations. In the 17th and 18th centuries certain important new taxes were established: from 1693 to 1698 the capitulation, which was re-established in 1707 with considerable modifications, and in 1710 the tax of the dixième, which became under Louis XV. the tax of the vinétiers. These two imposts had been established on the principle of equality, being designed to affect every subject in proportion to his income; but so strong was the system of privileges, that as a matter of fact the chief burden fell upon the roturiers. The income of a roturier who was not exempt was thus subject in turn to three direct imposts: the taille, the capitulation and the vinétiers, and the apportioning or assessment of these was not only arbitrary. In addition to indirect taxation strictly so called, which was very extensive in the 17th and 18th centuries, France under the ancien régime was subject to the traîtes, or customs, which were not only levied at the frontiers on foreign trade, but also included many internal customs-houses for trade between different provinces. Their origin was generally due to historical causes; thus, among the provinces répulsées étrangères were those which in the 14th century had refused to pay the aids for the ransom of King John, also certain provinces which had refused to allow customs offices to be established on their foreign frontier. Colbert had tried to abolish these internal duties, but had only succeeded to a limited extent.

The indirect taxes, the traîtes and the revenues of the royal domain were farmed out by the crown. At first a separate contract had been made for each impost in each election, but later they were combined into larger lots, as is shown by the name of one of the customs districts, l'enciente des cinq grosses fermes. From the reign of Henry IV. on the levying of each indirect impost was farmed en bloc for the whole kingdom, a system known as the fermes générales; but the real ferme générale, including all the imposts and revenues which were farmed in the whole of France, was only established under Colbert. The ferme générale was a powerful company, employing a vast number of men, most of whom enjoyed various privileges. Besides the royal taxes, seigniorial imposts survived under the form of tolls and market dues. The lords also often possessed local monopolies, e.g., the right of the common bakehouse (four banal), which were called les banalités.

The organization of the royal courts of justice underwent but few modifications during the ancien régime. The number of parlements, of cours des aides and of cours des comptes increased; in the 17th century the name of conseil supérieur was given to some new bodies which actually discharged the functions of the parlement, this being the period of the decline of the parlement. In the 16th century, under Henry II., had been created présidiaux, or courts of final jurisdiction, intended to avoid numerous appeals in small cases, and above all to avoid a final appeal to the parlements. Seigniorial courts survived, but were entirely subordinate to the royal jurisdictions and were badly officered by ill-paid and ignorant judges, the lords having long ago lost the right to sit in them in person. Their chief use was to deal with cases concerning the payment of feudal dues to the lord. Both lawyers and people would have preferred only two degrees of justice; and an ordinance of May 1788 realized this desire in the main. It did not suppress the seigniorial jurisdictions, but made their extinction a certainty by allowing litigants to ignore them and go straight to the royal judges. This was, however, reversed on the recall of Necker and the temporary triumph of the parlements.

The ecclesiastical jurisdictions survived to the end, but with diminished scope. Their competency had been considerably reduced by the Ordinance of Villers Cotterets of 1539, and by an edict of 1693. But a series of ingenious legal theories had been principally efficacious in gradually depriving them of most of the cases which had hitherto come under them. In the 18th century the privilege of clergy did not prevent civil suits in which the clergy were defendants from being almost always taken before secular tribunals, and ever since the first half of the 17th century, for all grave offences, or cas privilégiés, the royal judge could pronounce a sentence of corporal punishment on a guilty cleric without this necessitating his previous degradation. The inquiry into the case was, it is true, conducted jointly by the royal and the ecclesiastical judge, but each of them pronounced his sentence independently. All cases concerning benefices came before the royal judges. Finally, the process of the officiés had no longer as a rule any jurisdiction over laymen, even in the matter of marriage, except in questions of betrothals, and sometimes in cases of opposition to marriages.
The parish priests, however, continued to enter declarations of baptisms, marriages and burials in registers kept according to the civil laws.

The general customs of the pays coutumiers were almost all officially recorded in the 16th century, definite procedure for this purpose having been adopted at the end of the 15th century. Drafts were prepared by the officials of the royal courts in the chief town of the district in which the particular customs were valid, and were then submitted to the government. The king then appointed commissioners to visit the district and promulgate the customs on the spot. For the purpose of this publication the lords, lay and ecclesiastical, of the district, with representatives of the towns and of various bodies of the inhabitants, were summoned for a given day to the chief town. In this assembly each article was read, discussed and put to the vote. Those which were approved by the majority were thereafter decreed (décrits) by the commissioners in the king's name; those which gave rise to difficulties were put aside for the parlement to settle when it registered the coutume. The coutumes in this form became practically written law; henceforward their text could only be modified by a formal revision carried out according to the same procedure as the first version. Throughout the 16th century a fair number of coutumes were thus revised (réformées), with the express object of profiting by the observations and criticisms on the first text which had appeared in published commentaries and notes, the most important of which were those of Charles Dumoulin. In the 16th century there had been a revival of the study of Roman law, thanks to the historical school, among the most illustrious representatives of which were Jacques Cujas, Hugues Donace and Jacques Godefroy; but this study had only slight influence on practical jurisprudence. Certain institutions, however, such as contracts and obligations, were regulated throughout the whole of France by the principles of Roman law.

The coutumes were divided into divisions, letters, patents, emanating from the king, became more and more frequent; but the character of the grandes ordonnances, which were of a far-reaching and comprehensive nature, underwent a change during this period. In the 14th, 15th and 16th centuries they had been mainly ordonnances de réformation (i.e. revising previous laws), which were most frequently drawn up after a sitting of the states general, in accordance with the suggestions submitted by the deputies. The last of this type was the ordinance of 1650, promulgated after the states general of 1614 and the assemblies of notables which had followed it. In the 17th and 18th centuries they became essentially codifications, comprising a systematic and detailed statement of the whole branch of law. There are two of these series of codifying ordinances: the first under Louis XIV., inspired by Colbert and carried out under his direction. The chief ordinances of this group are that of 1667 on civil procedure (code of civil procedure); that of 1670 on the examination of criminal cases (code of penal procedure); that of 1673 on the commerce of merchants, and that of 1681 on the regulation of shipping, which form between them a complete code of commerce by land and sea. The ordinance of 1670 determined the formalities of that secret and written criminal procedure, as opposed to the hearing of both parties in a suit, which formerly obtained in France; it even increased its severity, continuing the employment of torture, binding the accused by oath to speak the truth, and refusing them counsel save in exceptional cases. The second series of codifications was made under Louis XV., through the action of the chancellors d'Aguerreau. Its chief result was the regulation, by the ordinances of 1731, 1735 and 1747, of deeds of gift between living persons, wills, and property left in trust. Under Louis XVI. some mitigation was made of the criminal law, notably the abolition of torture.

The Revolution.—With the Revolution France entered the ranks of constitutional countries, in which the liberty of men is guaranteed by fixed and definite laws; from this time on, she has had always (except in the interval between two revolutions) a written constitution, which could not be touched by the ordinary legislative power. The first constitution was that of 1791; the states general of 1789, transformed by their own will, backed by public opinion, into the Constituent Assembly, drew it up on their own authority. But their work did not stop there. They abolished the whole of the old public law of France and part of the criminal law, or rather, transformed it in accordance with the principles laid down by the philosophical spirit of the 18th century. The principles which were then proclaimed are still, on most points, the foundation of modern French law. The development resulting from this extraordinary impetus can be divided into two quite distinct phases: the first, from 1789 to the coup d'état of the 18th Brumaire in the year VIII., was the continuation of the impulse of the Revolution; the second includes the Consulate and the first Empire, and was, as it were, the marriage or fusion of the institutions arising from the Revolution with those of the ancien régime.

On the whole, the constitutional law of the Revolution is a remarkably unified whole, if we consider only the two constitutions which were effectively applied during this first phase, that of the 3rd of September 1791, and that of the 5th Fructidor in the year III. It is true that between them occurred the ultra-democratic constitution of the 24th of June 1793, the first voted by the Convention; but although this was ratified by the popular vote, to which it had been directly submitted, in accordance with a principle proclaimed by the Convention and kept in force under the Consulate

Land tenure.
and the Empire, it was never carried into effect. It was first suspended by the establishment of the revolutionary government strictly so called, and after Thermidor, under the pretext of completing it, the Convention put it aside and made a new one, being taught by experience. As long as it existed it was the sovereign assembly of the Convention itself which really exercised the executive power, governing chiefly by means of its great committees.

The constitution of 1791 was without doubt monarchical, in so far as it preserved royalty. The constitution of the year III. was, on the contrary, republican. The horror of monarchy was still so strong at that time that an executive college was created, a Directory of five members, one of whom retired every year; they were elected by a complicated and curious procedure, in which each of the two legislative councils played a distinct part. But this difference, though apparently essential, was not in reality very profound; this is proved, for example, by the fact that the Directory had distinctly more extensive powers than those conferred on Louis XVI. by the Constituent Assembly. On almost all points of importance the two constitutions were similar. They were both preceded by a statement of principles, a "Declaration of the Rights of Man and of the Citizen." They were both based on two principles which they construed alike: the sovereignty of the people and the separation of powers. Both of them, with the exception of what has been said with regard to the ratification of constitutions after 1791, recognized only representative government. From the principle of the sovereignty of the people they had not deduced universal suffrage; though, short of this, they had extended the suffrage as far as possible. According to the constitution of 1791, in addition to the conditions of age and residence, an elector was bound to pay a direct contribution equivalent to three days' work; the constitution of the year III. recognized the payment of any direct contribution as sufficient; it even conferred on every citizen the right of having himself enrolled, without any other qualification than a payment equivalent to three days' work, and thus to become an elector. Further, neither of the two constitutions admitted of a direct suffrage; the elections were carried out in two stages, and only those who paid at a higher rating could be chosen as electors for the second stage. The executive power, which was in the case of both constitutions clearly separated from the legislative, could not initiate legislation. The Directory had no veto; Louis XVI. had with difficulty obtained a merely suspensive veto, which was overridden in the event of three legislatures successively voting against it. The right of the king's ministers to have the Council of Ministers consulted, which had been a sovereign law at 1791, was now ordered by the king nor the Directory. Neither the king's ministers nor those of the Directory could be members of the legislative body, nor could they even be chosen from among its ranks. The ministers of Louis XVI. had, however, thanks to an unfortunate inspiration of the Constituent Assembly of 1791, the right of entry to, and, to a certain extent, of speaking in the Legislative Assembly; the constitution of the year III. showed greater wisdom in not bringing them in any way into contact with the legislative power. The greatest and most notable difference between the two constitutions was that that of 1791 established a single chamber which was entirely renewed every two years; that of the year III., on the contrary, profiting by the lessons of the past, established two chambers, one-third of the members of which were renewed every year. Moreover, the two chambers, the Council of Five Hundred and the Council of Ancients, were appointed by the same electors, and almost the only difference between their members was that of age.

The Revolution entirely abolished the ancien régime, and in the first instance whatever remained of feudalism. The Constituent Assembly, in the course of its immense work of settlement, wished to draw distinctions, abolishing absolutely, without indemnity, all rights which had amounted in the beginning to a usurpation and could not be justified, e.g. serfdom and seigniorial courts of justice. On the other hand, it declared subject to redemption such feudal charges as had been the subject of contract or of a concession of lands. But as it was almost impossible to discover the exact origin of various feudal rights, the Assembly had proceeded to do this by means of certain legal assumptions which sometimes admitted of a proof to the contrary. It carefully regulated the conditions and rate of repurchase, and forbade the creation in the future of any perpetual charge which could not be redeemed: a principle that has remained permanent in French law. This was a rational and equitable solution; but in a period of such violent excitement it could not be maintained. The Legislative Assembly declared the abolition without indemnity of all feudal rights for which the original deed of concession could not be produced; and to produce this was, of course, in most cases impossible. Finally, the Convention entirely abolished all feudal rights, and commanded that the old deeds should be destroyed; it maintained on the contrary, though subject to redemption, those tenures and charges which were solely connected with landed property and not feudal.

With feudalism had been abolished serfdom. Further, the Constituent Assembly suppressed nobility; it even forbade any one to assume and bear the titles, emblems and arms of nobility. Thus was established the equality of citizens before the law. The Assembly also proclaimed the liberty of labour and industry, and suppressed the corporations of artisans and workmen, the jاردons and matristes, as Turgot had done. But, in order to maintain this liberty of the individual, it forbade all associations between workmen or employers to refuse to work or to give work except on given conditions. Such, for a long time, was French legislation on this point.

The Constituent Assembly gave to France a new administrative division, that into departments, districts, cantons and communes; and this division, which was intended to make the old provincial distinctions disappear, had to serve all purposes, the department being the unit for all public services. This settlement was definitive, with the exception of certain modifications in detail, and exists to the present day. But there was a peculiar administrative organism depending on this arrangement. The constitution of 1791, it is true, made the king the titular head of the executive power; but the internal administration of the kingdom was not actually in his hands. It was deputed, under his orders, to delegates elected in each department, district or commune. The municipal bodies were directly elected by citizens duly qualified; other bodies were chosen by the method of double election. Each body consisted of two parts: a council, for deliberative purposes, and a bureau or directoire chosen by the council from among its numbers to form the executive. These were the only instruments for the general administration and for that of the direct taxes. The king could, it is true, annul the illegal acts of these bodies, but not dismiss their members; he could merely suspend them from exercising their functions, but the matter then went before the Legislative Assembly, which could maintain or remit the suspension as it thought fit. The king had not a single agent chosen by himself for general administrative purposes. This was a reaction, though a very exaggerated one, against the excessive centralization of the ancien régime, and resulted in an absolute administrative anarchy. The organization of the revolutionary government partly restored the central authority; the councils of the departments were suppressed; the Committee of Public Safety and the representatives of the people on mission were able to remove and replace the members of the elected bodies, and also, by an ingenious arrangement, national agents were established in the districts. The constitution of the year III. continued in this course, simplifying the organization established by the Constituent Assembly, while maintaining its principle. The department had an administration of five members, elected as in the past, but having executive as well as deliberative functions. The district was suppressed. The communes retained only a
The Constituent Assembly decided on the complete reorganization of the judicial organization. This was accomplished on a very simple plan, which realized that the two degrees of justice which, as we have noticed, was that of France under the ancien régime. In the lower degrees it created in each canton a justice of peace (juge de paix), the idea and name of which were borrowed from England, but which differed very much from the English justice of the peace. He judged, both with and without appeal, civil cases of small importance; and, in cases which did not come within his competency, it was his duty to try to reconcile the parties. In each district was established a civil court composed of five judges. This completed the judicial organization, except for the court of cassation, which had functions peculiar to itself, never judging the facts of the case but only the application of the law. For cases coming under the district court, the Assembly had completely abolished the guarantee of the appeal in cases involving sums above a certain figure. But by a curious arrangement the district tribunals could hear appeals from one another. With regard to penal prosecutions, there was in each department a criminal court which judged crimes with the assistance of a jury; it consisted of judges borrowed from district courts, and had its own president and public prosecutor. Correctional tribunals, composed of juges de paix, dealt with misdemeanors. The Assembly preserved the commercial courts, or consuljurisdictions, of the ancien régime. There was a court of cassation, the purpose of which was to preserve the unity of jurisprudence in France; it dealt with matters of law and not of fact, considering appeals based on the violation of law, whether in point of matter or of form, and if such violation were proved, sending the matter before another tribunal of the same rank for re-trial. All judges were elected for a term of years; the juges de paix by the primary assembly of the canton, the district judges by the electoral assembly consisting of the electors of the second degree for the district, the members of the court of cassation by the electors of the departments, who were divided for the purpose into two series, which voted alternately. The Constituent Assembly decided that no guarantee of the profession of lawyer from all judges except the juges de paix. But the system was really the same as that of the administrative organization. The king only appointed the commissaires du roi attached to the district courts, criminal tribunals and the court of cassation; but the appointment once made could not be revoked by him. These commissaries fulfilled one of the functions of the old ministère public, their duty being to demand the application of laws. The Convention did not change this general organization; but it suppressed the professional guarantee required in the case of candidates for a judgeship, so that henceforth all citizens were eligible; and it also caused new elections to take place. Moreover, the Convention, either directly or by means of one of its committees, not infrequently removed and replaced judges without further election. The constitution of the year III. preserved this system, but introduced one considerable modification. It suppressed the district courts, and in their place created in each department a civil tribunal consisting of twenty judges. The idea was a happy one, for it gave the courts more importance, and therefore more weight and dignity. But this reform, beneficial as it would be nowadays, was at the time premature, in view of the backward condition of means of communication.

The Constituent Assembly suppressed the militia and maintained the standing army, according to the old type, the numbers of which were henceforth to be fixed every year by the Legislative Assembly. The army was to be recruited by voluntary enlistment, carefull rules for which were drawn up; the only change was in the system of appointment to ranks; promotion went chiefly by seniority, and in the lower ranks a system of nomination by equals or inferiors was organized. The Assembly proclaimed, however, the principle of compulsory and personal service; but under a particular form, that of the National Guard, to which all qualified citizens belonged, and in which almost all ranks were conferred by election. Its chief purpose was to maintain order at home; but it could be called upon to furnish detachments for defence against foreign invasion. This was an institution which, with many successive modifications, and after various long periods of inactivity followed by a revival, lasted more than three-quarters of a century, and was not suppressed till 1871. For purposes of war the Convention, in addition to voluntary enlistments and the resources furnished by the National Guards, and setting aside the forced levy of 200,000 men in 1793, decided on the expedition of calling upon the communes to furnish men, a course which revived the principle of the old militia. But the Directory drew up an important military law, that of the 6th Fructidor of the year VI., which established compulsory military service for all, under the form of conscription strictly so called. Frenchmen aged from 20 to 25 were divided into 4 or 5 categories of age, and were liable until they were 25 years old to be called up for active service, the whole period of service not exceeding four years. No class was called upon until the younger classes had been exhausted, and the sending of substitutes was forbidden. This law, with a few later modifications, provided for the French armies up to the end of the Empire.

The Constituent Assembly abolished nearly all the taxes of the ancien régime. Almost the only taxes preserved were the stamp duty and that on the registration of acts (the old contrôle and centième denier), and these were completely reorganized; the customs were maintained only at the frontiers for foreign trade. In the establishment of new taxes the Assembly was influenced by two sentiments: the hatred which had been inspired by the former arbitrary taxation, and the influence of the school of the Physiocrats. Consequently it did away with indirect taxation on objects of consumption, and made the principal direct tax the tax on land. Next in importance were the contribution personnelle et mobilière et la palétière. The essential elements of the former were a sort of capital tax equivalent to three days' work, which had a destructive and definite sign of a qualified citizen, and a tax on personal income, calculated according to the rent paid. The palétières were paid by traders, and were also based on the amount of rent. These taxes, though considerably modified later, are still essentially the basis of the French system of direct taxation. The Constituent Assembly had on principle repudiated the tax on the gross income, much favoured under the ancien régime, which everybody had felt to be arbitrary and oppressive. The system of public contributions under the Convention was arbitrary and revolutionary, but the councils of the Directory, side by side with certain bad laws devised to tide over temporary crises, made some excellent laws on the subject of taxation. They resumed the regulation of the land tax, improving and partly altering it, and also dealt with the contribution personnelle et mobilière, the palétières, and the stamp and registration duties. It was at this time, too, that the door and window tax, which still exists, was provisionally established; there was also a partial reappearance of indirect taxation, in particular the octrois of the towns, which had been suppressed by the Constituent Assembly.

The Constituent Assembly gave the Protestants liberty of worship and full rights; it also gave Jews the status of citizen, which they had not had under the ancien régime, together with political rights. With regard to the Catholic Church, the Assembly placed at the disposal of the nation the property of the clergy, which had already, in the course of the 18th century, been regarded by most political
writers as a national possession; at the same time it provided for salaries for the members of the clergy and pensions for those who had been monks. It abolished tithes and the religious orders, and forbade the reformation of the latter in the future. The ecclesiastical districts were next reorganized, the department being always taken as the chief unit, and a new church was organized by the civil constitution of the clergy, the bishops being elected by the electoral assembly of the department (the usual electors), and the curés by the electoral assembly of the district. This was an unfortunate piece of legislation, inspired partly by the old Gallician spirit, partly by the theories on civil religion of J. J. Rousseau and his school, and, together with the civic oath imposed on the clergy, it was a source of endless troubles. The constitutional church established in this way was, however, abolished as a state institution by the Convention. By laws of the years III. and IV. the Convention and the Directory, in proclaiming the liberty of worship, declared that the Republic neither endowed nor recognized any form of worship. Buildings formerly consecrated to worship, which had not been alienated, were again placed at the disposal of worshippers for this purpose, but under conditions which were hard for them to accept.

The Assemblies of the Revolution, besides the laws which, by abolishing feudalism, altered the character of real property, passed some others concerning civil law. The most important are those of 1792, passed by the Legislative Assembly, which organized the registers of the état civil kept by the municipalities, and laid down rules for marriage as a purely civil contract. Divorce was admitted to a practically unlimited extent; it was possible not only for causes determined by law, and by mutual consent, but also for incompatibility of temper and character proved, by either husband or wife, to be of a persistent nature. Next came the laws of the Convention as to inheritance, imposing perfect equality among the natural heirs and endeavouring to ensure the division of properties. Illegitimate children were considered by these laws as on the same level with legitimate children. The Convention and the councils of the Directory also made excellent laws on the administration of hypothèques, and worked at the preparation of a Civil Code (see Code Napoléon). In criminal law their work was still more important. In 1791 the Constituent Assembly gave France her first penal code. It was inspired by humanitarian ideas, still admitting capital punishment, though accompanied by no cruelty in the execution; but none of the remaining punishments was for life. Long imprisonment with hard labour was introduced. Finally, a reaction against the former system of arbitrary penalties, there came a system of fixed penalties determined, both as to its assessment and its nature, for each offence, which the judge could not modify. The Constituent Assembly also reformed the procedure of criminal trials, taking English law as model. It introduced the jury, with the double form of jury d'acquission and jury de jugement. Before the judges procedure was always public and oral. The prosecution was left in principle to the parties concerned, plaintiffs or dénonciateurs civils, and the preliminary investigation was handed over to two magistrates; one was the juge de paix, as in English procedure at this period, and the other a magistrate chosen from the district court and called the directeur du jury. The Convention, before separating, passed the Code des délits et des peines of the 3rd Brumaire in the year IV. This piece of work, which was due to Merlin de Douai, was intended to deal with criminal procedure and penal law; but only the first part could be completed. It was the procedure established by the Constituent Assembly, but further organized and improved.

The Consulate and the Empire. The constitutions of the Consulate and the Empire is to be found in a series of documents called later the Constitutions de l'Empire, the constitution promulgated during the Hundred Days being consequently given the name of Acte additionnel aux Constitutions de l'Empire. These documents consist of (1) the Constitution of the 22nd Frimaire of the year VIII., the work of Sieyès and Bonaparte, the text on which the others were based; (2) the senatus consulte of the 16th Thermidor in the year X., establishing the consulate for life; and (3) the senatus consulte of the 28th Floréal in the year XII., which created the Empire. These constitutional acts, which were all, whether in their full text or in principle, submitted to the popular vote by means of a plébiscite, had all the same object: to assure absolute power to Napoleon, while preserving the forms and appearance of liberty. Popular suffrage was maintained, and even became universal; but, since the system was that of suffrage in many stages, which, moreover, varied very much, the citizens in effect merely nominated the candidates, and it was the Senate, playing the part of grand électeur which Sieyès had dreamed of as his own, which chose from among them the members of the various so-called elected bodies, even those of the political assemblies. According to the constitution of the year VIII., the first consul (to whom had been added two colleagues, the second and third consuls, who did not disappear until the Empire) possessed the executive power in the widest sense of the word, and he alone could initiate legislation. There were three representative assemblies in existence, elected as we have seen; but one of them, the Corps Législatif, passed laws without discussing them, and without the power of amending the suggestions of the government. The Tribunate, on the contrary, discussed them, but its vote was not necessary for the passing of the law. The Senate was the guardian and preserver of the constitution; in addition to its role of grand électeur, its chief function was to annul laws and acts submitted to it by the Tribunate as being unconstitutional. This original organization was naturally modified during the course of the Consulate and the Empire; not only did the emperor obtain the right of directly nominating senators, and the princes of the imperial family, and grant dignitaries of the Empire that of entering the Senate by right; but a whole body, the Tribunate, which was the only one which could preserve some independence, disappeared, without resort having been had to a plebiscite; it was modified and weakened by senatus consulte of the year X., and was suppressed in 1807 by a mere senatus consulte. The importance of another body, on the contrary, the conseil d'état, which had been formed on the improved type of the ancient conseil du roi, and consisted of members appointed by Napoleon and carefully chosen, continually increased. It was this body which really prepared and discussed the laws; and it was its members who advocated them before the Corps Législatif, to which the Tribunate also sent orators to speak on its behalf. The ministers, who had no voice in the constitution of the legislative power, were merely the agents of the head of the state, the Emperor himself. Napoleon, however, found these powers insufficient, and arranging to himself others, a fact which the Senate did not forget when it proclaimed his downfall. Thus he frequently declared war upon his own authority, in spite of the provisions to the contrary made by the constitution of the year VIII.; and similarly, under the form of décrets, made what were really laws. They were afterwards called décrets-lois, and those that were not indissolubly associated with the political régime of the Empire, and survived it, were subsequently declared valid by the court of cassation, on the ground that they had not been submitted to the Senate as unconstitutional, as had been provided by the constitution of the year VIII.

This period saw the rise of a whole new series of great organic laws. For administrative organization, the most important was that of the 28th Pluviose in the year VIII. It established as chief authority for each department a prefect, and side by side with him a conseil général for deliberative purposes; for each arrondissement (corresponding to the old district) a sub-prefect (sous-préfet) with a conseil d'arrondissement; and for each commune, a mayor and a municipal council. But all these officials, both the members of the councils and the individual agents, were appointed by the head of the state or by the prefect, so that centralization was restored more completely than ever. Together with the prefect there was also established a conseil
de préfecture, having administrative functions, and generally acting as a court of the first instance in disputes and litigation arising out of the acts of the administration; for the Constituent Assembly had removed such cases from the jurisdiction of the civil tribunals, and referred them to the administrative bodies themselves. The final appeal in these disputes was to the conseil d'État, which was supreme judge in these matters. In 1807 was created another great administrative jurisdiction, the cour des comptes, after the pattern of that which had existed under the ancien régime.

Judicial organization had also been fundamentally altered. The system of election was preserved for a time in the case of the juge de paix and the members of the court of cassation, but finally disappeared there, even where it had already been no more than a form. The magistrates were in principle appointed for life, but under the Empire a device was found for evading the rule of irremovability. For the judgment of civil cases there was a court of first instance in every arrondissement, and above these a certain number of courts of appeal, each of which had within its province several departments. The separate criminal tribunals were abolished in 1809 by the Code d'Instruction Criminelle, and the magistrates forming the cour d'assises, which judged crimes with the aid of a jury, were drawn from the courts of appeal and from the civil tribunals. The jury d'accusation was also abolished by the Code d'Instruction Criminelle, and the right of pronouncing the indictment was transferred to a chamber of the court of appeal. The correctional tribunals were amalgamated with the civil tribunals of the first instance. The tribunal de cassation, which took under the Empire the name of cour de cassation, consisted of magistrates appointed for life, and still kept its powers. The ministère public (consisting of imperial avocats and procureurs) was restored in practically the same form as under the ancien régime.

The former system of taxation was preserved in principle, but with one considerable addition: Napoleon re-established indirect taxation on articles of consumption, which had been abolished by the Constituent Assembly; the chief of these were the duties on liquor (droits réunis, or excise) and the monopoly of tobacco.

The Concordat. — The Concordat of 1801, concluded by Napoleon with the papacy on the 26th Messidor of the year IX, re-established the Catholic religion in France as the form of worship recognized and endowed by the state. It was in principle drawn up on the lines of that of 1516, and assured to the head of the French state in his dealings with the papacy the same prerogatives as had formerly been enjoyed by the kings; the chief of these was that he appointed the bishops, who afterwards had to ask the pope for canonical institution. The territorial distribution of dioceses was preserved practically as it had been left by the civil constitution of the clergy. The state guaranteed the payment of salaries to bishops and curés; and the pope agreed to renounce all claims referring to the appropriation of the goods of the clergy made by the Constituent Assembly. Later on, a decree restored to the fabriques (vestries) such of their former possessions as had not been alienated, and the churches which had not been alienated were restored for the purposes of worship. The law of the 18th Germinal in the year X., ratifying the Concordat, reasserted, under the name of articles organiques du culte catholique, all the main principles of the old doctrine of the liberties of the Gallican Church. The Concordat did not include the restoration of the religious orders and congregations; Napoleon sanctioned by decrees only a few establishments of this kind.

One important creation of the Empire was the university. The ancien régime had had its universities for purposes of instruction and for the conferring of degrees; it had also, though without any definite organization, such secondary schools as the towns admitted within their walls, and the primary schools of the parishes. The Revolution suppressed the universities and the teaching congregations. The constitution of the year III. proclaimed the liberty of instruction and commanded that public schools, both elementary and secondary, should be established. Under the Directory there was in each department an école centrale, in which all branches of human knowledge were taught. Napoleon, developing ideas which had been started in the second half of the 18th century, founded by laws and decrees of 1806, 1808 and 1811 the Université de France, which provided and organized higher, secondary and primary education; this was to be the monopoly of the state, carried on by its facultés, lycées and primary schools. No private educational establishment could be opened without the authorization of the state.

But chief among the documents dating from this period are the Codes, which still give laws to France. These are the Civil Code of 1804, the Code de Procédure Civile of 1806, the Code de Commerce of 1807, the Code d'Instruction Criminelle of 1809, and the Code Pénal of 1810. These monumental works, in the elaboration of which the conseil d'État took the chief part, contributed, to a greater or less extent, towards the fusion of the old law of France with the laws of the Revolution. It was in the case of the Code Civil that this task presented the greatest difficulty (see CODE NAPOLEON).

The Codes. — The Code de Commerce was scarcely more than a reformation of the ordonnances of 1673 and 1681; while the Code de Procédure Civile borrowed its chief elements from the ordonnances of 1667. In the case of the Code d'Instruction Criminelle a distinctly new departure was made; the procedure introduced by the Revolution into courts where judgment was given remained public and oral, with full liberty of defence; the preliminary procedure, however, before the examining court (juge d'instruction ou chambre des mises en accusation) was borrowed from the ordonnance of 1670; it was the procedure of the old law, without its cruelty, but secret and written, and generally not in the presence of both parties. The Code Pénal maintained the principles of the Revolution, but increased the penalties. It substituted for the system of fixed penalties, in cases of temporary punishment, a maximum and a minimum, between the limits of which judges could assess the amount. Even in the case of misdemeanours, it admitted the system of extenuating circumstances, which allowed them still further to decrease and alter the penalty in so far as the offence was mitigated by the circumstances (See CODE NAPOLEON I.).

The Restored Monarchy. — The Restoration, or the Monarchy of July, though separated by a revolution, form one period in the history of French institutions, a period in which the same régime was continued and developed. This was the constitutional monarchy, with a parliamentary body consisting of two chambers, a system imitated from England. The same constitution was preserved under these two monarchies—the charter granted by Louis XVIII. in 1814. The revolution of 1830 took place in defence of the charter which Charles X. had violated by the ordonnances of July, so that this charter was naturally preserved under the “July Monarchy.” It was merely revised by the Chamber of Deputies, which had been one of the movers of the revolution, and by what remained of the House of Peers. In order to give the constitution the appearance of originating in the will of the people, the preface, which made it appear to be a favour granted by the king, was destroyed. The two chambers acquired the initiative in legislation, which had not been recognized as theirs under the Restoration, but from this time on belonged to them equally with the king. The sittings of the two chambers were henceforth held in public; but this chamber underwent another and more fundamental transformation. The peers were nominated by the king, with no limit of numbers, and according to the charter of 1814 their appointment could be either for life or hereditarily; but, in execution of an ordinance of Louis XVIII., during the Restoration they were always appointed under the latter condition. Under the July Monarchy their tenure of office was for life, and the king had to choose them from among twenty-two classes of notables fixed by law. The franchise for the election of the Chamber of Deputies had been limited by a system of money qualifications; but while, under the
Restoration, it had been necessary, in order to be an elector, to pay three hundred francs in direct taxation; this sum was reduced in 1837 to two hundred francs, while in certain cases even a smaller amount sufficed. In order to be elected as a deputy it was necessary, according to the charter of 1814, to pay a thousand francs in direct taxation, and according to that of 1830 five hundred francs. From 1817 onwards there was direct suffrage, the electors directly electing the deputies. The idea of those who had framed the charter of 1814 had been to give the chief influence to the great landed proprietors, though the means adopted to this end were not adequate; in 1830 the chief aim had been to give a preponderating influence to the middle and lower middle classes, and this had met with greater success. The House of Peers, under the name of cours des pairs, had also the function of judging attempts and plots against the security of the state, and it had frequently to exercise this function both under the Restoration and the July Monarchy.

This was a period of parliamentary government; that is, of government by a cabinet, resting on the responsibility of the ministers to the Chamber of Deputies. The only interruption was that caused by the resistance of Charles X. at the end of his reign, which led to the revolution of July. Parliamentary government was practised regularly and in an enlightened spirit under the Restoration, although the Chamber had not then the power of taxation. It is noteworthy that during this period the right of the House of Peers to force a ministry to resign by a hostile vote was not recognized. By the creation of a certain number of new peers, a journée de pairs, as it was then called, the majority in this House could be changed when necessary. But the government of the Restoration had to deal with two extreme parties of a very opposite nature: the Ultras, who wished to restore as far as possible the ancien régime, to whom were due the acts of the chambre introuvable of 1816, and later the laws of the ministry of Villèle, especially the law of sacrilege and that voting compensation to the dispossessed nobles, known as the miliard des émigrés; and on the other hand the Liberals, including the Bonapartists and Republicans, who were attached to the principles of the Revolution. In order to prevent either of these parties from predominating in the chamber, the government made a free use of its power of dissolution. It further employed two means to check the progress of the Liberals; firstly, there were various alterations successively made in the electoral law, and the press laws, frequently restrictive in their effect, which introduced the censorship and a preliminary authorization of the case of periodicals publications, and gave the correctional tribunals jurisdiction in cases of press offenses.

The best electoral law was that of 1817, and the best press laws were those of 1819; but these were not of long duration. Under the July Monarchy parliamentary government, although its machinery was further perfected, was not so brilliant. The majorities in the Chamber of Deputies were often uncertain, so much so, that more than once the right of dissolution was exercised in order to try new elections to arrive at an undivided and certain majority. King Louis Philippe, though sober-minded, wished to exercise a personal influence on the policy of the cabinet, so that there were then two schools, represented respectively by Thiers and Guizot, one of which held the theory that "the king reigns but does not govern"; while the other maintained that he might exercise a personal influence, provided that he could rely on a ministry supported by a majority of the Chamber of Deputies. But the weak point in the July Monarchy was above all the question of the franchise. A powerful movement of opinion set in towards demanding an extension, some wishing for universal suffrage, but the majority proposing what was called the adhesion des capacités, that is to say, that the number of qualified electors should be added to those citizens who, by virtue of their professions, capacity or acquirements, were inscribed after them on the general list for juries. But the government obstinately refused all electoral reform, and held to the law of 1831. It also refused parliamentary reform, by which was meant a rule which would have made most public offices incompatible with the position of deputy, the Chamber of Deputies being at that time full of officials. The press, thanks to the Charter, was perfectly free, without either censorship or preliminary authorization, and press offenses were judged by a jury.

In another respect also the Restoration and the July Monarchy were at one, the second continuing the spirit of the first, viz. in maintaining in principle the civil, legal and administrative institutions of the Empire. The preface to the charter of 1814 sanctioned and guaranteed most of the legal rights won by the Revolution; even the alienation of national property was confirmed. It was said, it is true, that the old nobility regained their titles, and that the nobility of the Empire kept those which Napoleon had given them; but these were merely titles and nothing more; there was no privileged nobility, and the equality of citizens before the law was maintained. Judicial and administrative organization, the system of taxation, military organization, the relations of church and state, remained the same, and the university also continued to exist. The government did, it is true, negotiate a new Concordat with the papacy in 1817, but did not dare even to submit it to the chambers. The most important reform was that of the law concerning recruiting for the army. The charter of 1814 had promised the abolition of conscription, in the form in which it had been created by the law of the 22nd of March 1818 actually established the army in a new system. The contingent voted by the chambers for annual incorporation into the standing army was divided up among all the cantons; and, in order to furnish it, lots were drawn among all the men of a certain class, that is to say, among the young Frenchmen who arrived at their majority that year. Those who were not chosen by lot were definitely set free from military service. The sending of substitutes, a custom which had been permitted by Napoleon, was recognized. This was the type of all the laws on recruiting in France, of which there were a good number in succession up to 1867. On other points they vary, in particular as to the duration of service, which was six years, and later eight years, under the Restoration; but the system remained the same.

The Restoration produced a code, the Code forestier of 1827, for the regulation of forests (eaux et forêts). In 1816 a law had abolished divorce, making marriage indissoluble, as it had been in the old law. But the best laws of this period were those on finance. Now, for the first time, was introduced the practice of drawing up regular budgets, voted before the year to which they applied, and divided since 1810 into the budget of expenditure and the budget of revenue.

Together with other institutions of the Empire, the Restoration had preserved the exaggerated system of administrative centralization established in the year VIII.; and proposals for its relaxation submitted to the chambers had come to nothing. It was only under the July Monarchy that it was relaxed. The municipal law of the 21st of March 1831 made the municipal councils elective, and extended widely the right of voting in the elections for them; the maires and their assistants continued to be appointed by the government, but had to be chosen from among the members of the municipal councils. The law of the 22nd of June 1833 made the general councils of the departments also elective, and brought the adjonction des capacités into effect for their election. The powers of these bodies were enlarged in 1838, and they gained the right of electing their president. In 1833 was granted another liberty, that of primary education; but in spite of violent protestations, coming especially from the Catholics, secondary and higher education continued to be a monopoly of the state. Many organic laws were promulgated, one concerning the National Guard, which was reorganized in order to adapt to it the system of citizen qualifications; one in 1832 on the recruiting of the army, fixing the period of service at seven years; and another in 1834 securing the status of officers.

A law of the 11th of June 1842 established the great railway lines. In 1832 the Code Pénal and Code d'Instruction Criminelle were revised, with the object of lightening penalties; the system of extenuating circumstances, as recognized by a jury, was
FRANCE

extended to the judgment of all crimes. There was also a revision of Book III. of the Code de Commerce, treating of bankruptcy. Finally, from this period date the laws of the 3rd of May 1841, on expropriation for purposes of public utility, and of the 30th of June 1838, on the treatment of the insane, which is still in force. Judicial organization remained as it was, but the amount of the sum up to which civil tribunals of the first instance could judge without appeal was raised from 1000 francs to 1500, and the competency of the juges de paix was widened.

The Second Republic and the Second Empire.—From the point of view of constitutional law, the Second Republic and the Second Empire were each in a certain sense a return to the past. The former revived the tradition of the Assemblies of the Revolution; the latter was obviously and avowingly an imitation of the Consulate and the First Empire.

The provisional government set up by the revolution of the 24th of February 1848 proclaimed universal suffrage, and by this means was elected a Constituent Assembly, which sat till May 1849, and, after first organizing various forms of another provisional government, passed the Republican constitution of the 4th of November 1848. This constitution was preceded by a préface recalling the Declarations of Rights of the Revolution, gave the legislative power to a single permanent assembly, elected by direct universal suffrage, and entirely renewed every three years. The executive authority, with very extensive powers, was given to a president of the Republic, also elected by the universal and direct suffrage of the French citizens. The constitution was not very clear upon the point of whether it adopted parliamentary government in the strict sense, or whether the president, who was declared responsible, was free to choose his ministers and to retain or dismiss them at his own pleasure. This gave rise to an almost permanent dispute between the president, who claimed to have his own political opinions and to direct the government, and the Assembly, which wished to carry on the traditions of cabinet government and to make the ministers fully responsible to itself. Consequently, in January 1851, a solemn debate was held, which ended in the affirmation of the responsibility of ministers to the Assembly. On the other hand, the president, though very properly given great power by the constitution, was not immediately eligible for re-election on giving up his office. New Louis Napoleon was elected president on the 10th of December 1848 by a huge majority, wished to be re-elected. Various propositions were submitted to the Assembly in July 1851 with a view to modifying the constitution; but they could not succeed, as the number of votes demanded by the constitution for the convocation of a Constituent Assembly was not reached. Moreover, the Legislative Assembly elected in May 1849 was very different from the Constituent Assembly of 1848. The latter was animated by that spirit of harmony and, in the main, of adhesion to the Republic which had followed on the February Revolution. The new assembly, on the contrary, was composed for the most part of representatives of the old parties, and had monarchist aspirations. By the unfortunate law of the 31st of May 1850 it even tried by a subterfuge to restrict the universal suffrage guaranteed by the constitution. It suspended the right of holding meetings, but, on the whole, respected the liberty of the press. It was especially impelled to these measures by the growing fear of socialism. The result was the coup d'etat of the 2nd of December 1851. A detail of some constitutional importance is to be noted. This period of living croup d'état which had remained under the Restoration and the July Monarchy an administrative council and the supreme arbiter in administrative trials, acquired new importance under the Second Republic.

The ordinary conseillers d'état (en service ordinaire) were elected by the Legislative Assembly, and consultation with the conseil d'état was often insisted on by the constitution or by law. This was the means of obtaining a certain modifying power as a substitute for the second chamber, which had not met with popular approval. During its short existence the Second Republic produced many important laws. It abolished the penalty of death for political crimes, and suppressed negro slavery in the colonies. The election of conseillers généraux was thrown open to universal suffrage, and the municipal councils were allowed to elect the maires and their colleagues. The law of the 15th of March 1850 established the liberty of secondary education, but it conferred certain privileges on the Catholic clergy, a clear sign of the spirit of social conservatism which was the leading motive for its enactment. Certain humanitarian laws were passed, applying to the working classes.

With the coup d'état of the 2nd of December 1851 began a new era of constitutional plebeisites and disguised absolutism. The proclamations of Napoleon on the 2nd of December contained a criticism of parliamentary government, and formulated the wish to restore to France the constitutional institutions of the Consulate and the Empire, just as she had preserved their civil, administrative and military institutions. Napoleon asked the people for the powers necessary to draw up a constitution on these principles; the plebeisite issued in a vast majority of votes in his favour, and the constitution of the 14th of January 1852 was the result. It bore a strong resemblance to the constitution of the First Empire after 1807. The executive power was conferred on a consulate, comprised of the president of the Republic and very extended powers, and whose members (cardinals, marshals of France and admirals) and life members appointed by the head of the state, was charged with the task of seeing that the laws were constitutional, of opposing the promulgation of unconstitutional laws, and of receiving the petitions of citizens; it had also the duty of providing everything not already provided but necessary for the proper working of the constitution. The second assembly was the Corps Législatif, elected by direct universal suffrage for six years, which passed the laws, the government having the initiative in legislation. This body was not altogether a corps des muets, as in the year VIII., but its powers were very limited; thus the general session assured to it by the constitution was only for three months, and it could only discuss and put to the vote amendments approved by the conseil d'état; the ministers did not in any way come into contact with it and could not be members of it, being responsible only to the head of the state, and only the Senate having the right of accusing them before a high court of justice. The conseil d'état was composed of 100 members, and had the same authority as it had possessed from the year VII. 1814; and it was the assembly of him who supported projected laws before the Corps Législatif. To this was added a Draconian press legislation; not only were press offences, many of which were mere expressions of opinion, judged not by a jury but by the correctional tribunals; but further, political papers could not be founded without an authorization, and were subject to a regular administrative discipline; they could be warned, suspended or suppressed without a trial, by a simple act of the administration. The constitution of January 1852 was still Republican in nature, though less so than that of the year VIII. The period corresponding with the Consulate was also shorter in the case of Louis Napoleon. The year 1852 had not come to an end before a senatus consulte, that of the 10th of November, ratified by a plebeisite, re-established the imperial rank in favour of Napoleon III.; it also conferred on him certain new powers, especially with reference to the budget and foreign treaties; thus having the civil, which experience had revealed in the original structure of the person without. This period was called that of the empire autocratique. Further features of it were the free appointment of the maires by the emperor, the oath of fidelity to him imposed on all officials, and the legal organization of official candidates for the elections. Two measures marked the highest point reached by this system: the loi de sureté générale of the 27th of February 1858, which allowed the government to intern in France or Algeria, or to exile certain French citizens, without a trial. The other was the senatus consulte of the 17th of February 1858, which made the validity of candidates for the Corps Législatif subject
The empire liberal.

One by one the different rules and proceedings of parliamentary government as it had existed in France regained their force. The first step was the decree of the 24th of November 1860, which re-established for each ordinary session the address voted by the chambers in response to the speech from the throne. In 1867 this movement took a more decisive form. It led to a new constitution, that of the 21st of May 1870, which was again ratified by popular suffrage. While maintaining the Empire and the imperial dynasty, it organized parliamentary government practically in the form in which it had operated under the July Monarchy, with two legislative chambers, the Senate and the Corps Législatif, the consent of both of which was necessary for legislation, and which, together with the emperor, had the initiative in this matter. The laws of the 11th of May 1868 and the 6th of June 1868 restored to a certain extent the liberty of the press and of holding meetings, though without abolishing offences of opinion, or again bringing press offences under the jurisdiction of a jury. Laws of the 22nd and 23rd of July 1870 gave the conseil générale, whose powers had been somewhat widened, the right of electing their residents, and provided that the maires and their colleagues should be chosen from among the members of the municipal councils.

The legislation of the Second Empire led to a considerable number of reforms. Its chief aim was the development of commerce, industry and agriculture, and generally the material prosperity of the country. The Empire, though restricting liberty in political matters, increased it in economic matters. Such were the decrees and laws of 1852 and 1853 relating to land-banks (établissements de crédit foncier) and that of 1857 on trade-marks, those of 1863 and 1867 on commercial companies, that of 1858 on general stores (magasins généraux) and warrants, that of 1856 on drainage, that of 1865 on the associations syndicales de propriétaires, that of 1866 on the mercantile marine. The law of the 14th of June 1865 introduced into France the institution, borrowed from England, of cheques. But of still greater importance for economic development than all these laws were the treaties concluded by the emperor with foreign powers, in order to introduce, as far as possible, free exchange of commodities; the chief of these, which was the model of all the others, was that concluded with Great Britain on January 9, 1866. Moreover, a decree of the 25th of May 1864 admitted for the first time the right of strikes and lock-outs among workmen or employers, annuling articles 414 and following of the Code Pénal, which had so far made them a penal offence, even when not accompanied by fraudulent practices, threats or violence, tending to hinder the liberty of labour. The superannuation fund (caisse des retraites pour la vieillesse), supported by voluntary payments from those participating in it, which had been created by the law of the 18th of June 1850, was reorganized and perfected, and a law of the 11th of July 1868 established, with the guarantee of the state, two funds for voluntary insurance, one in case of death, the other against accidents occurring in industrial or agricultural employment. A decree of 1863 established in principle the freedom of trades, and another in 1864 that of theatrical management.

Criminal law was the subject of important legislation. Two codes were promulgated on special points, the codes of military justice for the land forces (1857) and for the naval forces (1858). But the common law was also largely remodelled. A law of the 10th of June 1858, it is true, created certain new crimes, with a view to protecting the members of the imperial family, and that of the 17th of July 1856 increased the powers and independence of the juges d'instruction; but, on the other hand, useful improvements were introduced by laws of 1856 and 1865, and notably with regard to precautionary detention and provisional release with or without bail. A law of the 20th of May 1863 organized a simple and rapid procedure, copied from that followed in England before the police courts, for summary jurisdiction. A law of 1868 permitted the revision of criminal trials after the death of the condemned person. But the most far-reaching reforms took place in 1854, namely, the abolition of the total loss of civil rights which formerly accompanied condemnation to imprisonment for life, and the law of the 30th of May on penal servitude (travaux forçés) which substituted transportation to the colonies for the system of continental convict prisons. Finally, in 1863, there was a revision of the Code Pénal, which, in the process of lightening penalties, made a certain number of crimes into misdemeanours, and in consequence transferred the judgment of them from the assize courts to the correctional tribunals. In civil legislation may be noted the law of the 23rd of March 1855 on hypothecs (see Code Napoléon); that of the 22nd of July 1857, which abolished seizure of the person (contrainte par corps) for civil and commercial debts; and finally, the law of the 14th of July 1866, on literary copyright. The system of taxation was hardly modified at all, except for the establishment of a tax on the income arising from investments (shares and bonds of companies) in 1857, and the tax on carriages (1862). On the 1st of February 1868 was promulgated an important military law, which, however, passed the Corps Législatif with some difficulty. It asserted the principle of universal compulsory military service, at least, in time of war. It preserved, however, the system of drawing lots 'to determine the annual contingent to be incorporated into the standing army; the term of service was fixed at five years, and it was still permissible to send a substitute. But able-bodied men who were not included in the annual contingent formed a reserve force called the garde nationale mobile, each department organizing its own section. These gardes mobiles, though they were not effectively organized or exercised under the Empire, took part in the war of 1870-71.

The Third Republic.—The Third Republic had at first a provisional government, unanimously acclaimed by the people of Paris. It was accepted by France, exercised full powers, and sustained by no means ingloriously a desperate struggle against the enemy; a certain number of its décrets-lois are still in force. After the capitulation of Paris, a National Assembly was elected to treat with Germany. It was elected in accordance with the electoral law of 1849, which had been revived with a few modifications, and it met at Bordeaux to the number of 7,553 members on the 13th of February 1871. It was a sovereign assembly, since France had no longer a constitution, and for this very reason it claimed from the outset constitutional powers, the Republican party at the time, however, contested this claim, the majority in the assembly being frankly monarchist, though divided as to the choice of a monarch. But for some time the National Assembly either could not or would not exercise this power, and up to 1875 affairs remained in a provisional state, legalized and regulated this time by the Assembly. This was an application, though unconscious, of a form of government which M. Grévy had proposed to the Constituent Assembly in 1848. There was a single assembly, with one man elected by it as head of the executive power (the first to be elected was M. Thiers, who received the title of president of the Republic in August 1871), who was responsible to the Assembly and governed with the help of ministers chosen by himself, who were also responsible to him. Thiers fell on the 24th of May 1873. His place was taken by Marshal MacMahon, on whom the Assembly later conferred, in November 1873, the position of president of the Republic for seven years, when the refusal of the comte de Chambord to accept the tricolour in place of the white flag of the Bourbons had made any attempt to restore the monarchy impossible. Henceforth the definitive adoption of the Republican form of government became inevitable, and the opinion of the country began to turn in this direction, as was shown by the elections of deputies which took place to fill up the gaps occurring in the Assembly. The Assembly, however, shrank from the inevitable
solution, and when a discussion was begun in January 1875 on the projected constitutional laws prepared by the commission des trente, the only proposals made by the latter were for a complete organization of the powers of one man, Marshal MacMahon. But on the 30th of January 1875 was adopted, by 335 votes to 112, an amendment by M. Wallon which provided for the election of an indefinite succession of presidents of the Republic; this amounted to a definitive recognition of the Republic. In this connexion it has often been said that the Republic was established by a majority of one. This is not an accurate statement, for it was only the case on the first reading of the law; the majority on the second and third readings increased until it became considerable. There was a strong movement in the direction of a reconciliation between the parties; and there had been a rapprochement between the Republicans and the Right Centre. At the end of February were passed and promulgated two constitutional laws, that of the 25th of February 1875, on the organization of the public powers, and that of the 24th of February 1875, on the organization of the Senate. In the middle of the year they were supplemented by a third, that of the 10th of July 1875, on the relations between the public powers.

Thus was built up the actual constitution of France. It differs fundamentally, both in form and contents, from previous constitutions. As in its form, instead of a single methodical text divided into an uninterrupted series of articles, it consisted of three distinct laws. As to matter, it is obviously a work of an essentially practical nature, the result of compromise and reciprocal concessions. It does not lay down any theoretical principles, and its provisions, which were arrived at with difficulty, confine themselves strictly to what is necessary to ensure the proper operation of the governmental machinery. The result is a compromise between Republican principles and the rules of constitutional and parliamentary monarchy. On this account it has been accused, though unjustly, of being too monarchical. Its duration, by far the longest of any French constitution since 1791, is a sign of its value and vitality. It is in fact a product of history, and not of imagination. Its composition is as follows. The legislative power was given to two elective chambers, having equal powers, the vote of both of which is necessary for legislation, and both having the right of initiating and amending laws. The constitution assures them an ordinary session of five months, which opens by right on the second Tuesday in January. One house, the Chamber of Deputies, is elected by direct universal suffrage and is entirely renewed every four years; the other, the Senate, consists of 300 members, elected for a term of six years, on the 1st of February 1875, into two categories; 75 of the senators were elected for life, and irremovable, and the first of them were elected by the National Assembly, but afterwards it was the Senate itself which held elections to fill up vacancies. The 225 remaining senators were elected by the departments and by certain colonies, among which they were apportioned in proportion to the population; they are elected for nine years, a third of the house being renewed every three years. The electoral college in each department which nominated them included the deputies, the members of the general council of the department and of the councils of the arrondissements, and one delegate elected by each municipal council, whatever the importance of the commune. This was practically a system of election in two and, partly, three degrees, but with this distinguishing feature, that the electors of the second degree had not been chosen purely with a view to this election, but chiefly for the exercise of other functions. The most important elements in this electoral college were the delegates from the municipal councils, and by giving one delegate to each, to Paris just as to the smallest commune in France, the National Assembly intended to counterbalance the power of numbers, which governed the elections for the Chamber of Deputies, and, at the same time, to give a preponderance to the country districts. The 75 irremovable senators were another precaution against the danger from violent waves of public opinion. The executive power was entrusted to a president, elected for seven years (as Marshal MacMahon had been in 1871), by the Chamber and the Senate, combined into a single body, under the name of National Assembly. He is always eligible for re-election, and is irresponsible except in case of high treason. His powers are of the widest, including the initiative in legislation jointly with the two chambers, the appointment to all civil and military offices, the disposition, and, if he wish it, the leadership of the armed forces, the right of pardon, the right of negotiating treaties with foreign powers, and, in principle, of ratifying them on his own authority, the consent of the two chambers being required only in certain cases defined by the constitution. The nomination of conseillers d'état for ordinary service, whom the National Assembly had made elective, as in 1848, and elected itself, was restored to the president of the Republic, together with the right of dismissing them. But these powers he can only exercise through the medium of a ministry, politically and jointly responsible to the chambers, and forming a council, over which the president usually presides.

The French Republic is essentially a parliamentary republic. The right of dissolving the Chamber of Deputies before the expiration of its term of office belongs to the president, but in order to do so he must have, besides a ministry which will take the responsibility for it, the preliminary sanction of the Senate. The Senate is at the same time a high court of justice, which can judge the president of the Republic and ministers accused of crimes committed by them in the exercise of their functions; in these two cases the prosecution is instituted by the Chamber of Deputies. The Senate can also be called upon to judge any person accused of an attempt upon the safety of the state, who is then seized by a decree of the president of the Republic, drawn up in the council of ministers. Possible revision of the constitution is provided for very simply: it has to be proposed as a law, and for its acceptance a resolution passed by each chamber separately, by an absolute majority, is necessary. The revision is then carried out by the Senate and the Chamber of Deputies to form a National Assembly. There have been two revisions since 1875. The first time, in 1879, it was simply a question of transferring the seat of the government and of the chambers back to Paris from Versailles, where it had been fixed by one of the constitutional laws. The second time, in 1884, more fundamental modifications were required. The most important point was to change the composition and election of the Senate. With a view to this, the new constitutional law of the 14th of August 1884 abolished the constitutional character of a certain number of articles of the law of the 24th of February 1875, thus making it possible to try them by an ordinary court. This took place in the same year; the 75 senators for life were suppressed for the future by a process of extinction, and their seats divided among the most populous departments. Further, in the electoral college which elects the senators, there was allotted to the municipal councils a number of delegates proportionate to the number of members of the councils, which depends on the importance of the commune. The law of the 14th of August 1884 also modified the constitution in another important respect. The law of the 25th of February 1875 had admitted the possibility not only of a partial, but even of a total revision, which could affect and even change the form of the state. The law of the 14th of August 1884, however, declared that no proposition for a revision could be accepted which aimed at changing the republican form of government. The composition of the Chamber of Deputies was not fixed by the constitution, and consequently admitted more easily of variation. Since 1871 the mode of election has oscillated between the scrutin de liste for the departments and the scrutin uninominal for the arrondissements. The organic law of the 30th of November 1875 had established the latter system; in 1885 the scrutin de liste was established by law, but in 1889 the scrutin d'arrondissement was restored; and in this same year, on account of the ambitions of General Boulanger and the suggestion which was made for a sort of plebiscite in his favour, was passed the law on plural candidates, which forbids anyone to become a candidate for the Chamber of Deputies in more than one district at a time.
The system established by the constitution of 1875 has worked excellently in some of its departments; for instance, the mode of electing the president of the Republic. Between 1875 and 1906 there were seven elections, sometimes under tragic or very difficult conditions; the election has always taken place without delay or obstruction, and the choice has been of the best. The high court of justice, which has twice been called into requisition, in 1889 and in 1890–1900, has acted as an efficient check, in spite of the difficulties confronting such a tribunal when feeling runs high. Parliamentary government in the form set up by the constitution, besides the criticism to which this system is open in all countries where it is established, even in England, met with special difficulties in France. In the first place, the useful but rather secondary rôle assigned to the president of the Republic has by no means satisfied all those who have occupied this high office. Two presidents have resigned on the ground that their powers were insufficient. Another, even after re-election, had to withdraw in face of the opposition of the two chambers, being no longer able to obtain a parliamentary ministry. It is difficult, however, to accept the theory of an eminent American political writer, Mr John W. Burgess, 1 that in order to attain to a position of stable equilibrium, the French Republic ought to adopt the presidential system of the United States. In France this sharp division between the two powers has never been observed except in those periods when the representative assemblies were powerless, under the First and Second Empires. It is true that the apparent multiplicity of parties and their lack of discipline, together with the French procedure of interpellations and the orders of the day by which they are concluded, make the formation of homogeneous and lasting cabinets difficult; but since the end of the 19th century there has been great progress in this respect. Another difficulty arose in 1896. The Senate, appealing to the letter of the constitution and relying on its elective character, claimed the right of forcing a ministry to resign by its vote, in the same way as the Chamber of Deputies. The Senate was victorious in the struggle, and forced the ministry presided over by M. Léon Bourgeois to resign; but the precedent is not decisive, for in order to gain its ends the Senate had recourse to the means of refusing to sanction the taxes, declining to consider the proposals for the supplies necessary for the Madagascar expedition so long as the ministry which it was attacking was in existence. The weakest point in the French parliamentary organism is perhaps the right of dissolution. It is difficult of application, for the reason that the president must obtain the preliminary consent of the Senate before exercising it; moreover, this valuable right has been discredited by its abuse by Marshal MacMahon in the campaign of the 16th of May 1877, on which occasion he exercised his right of dissolution against a chamber, the moderate but decidedly republican majority in which was re-elected by the country.

The legislative reforms carried out under the Third Republic are very numerous. As to public law, it is only possible to mention the new codes of civil and criminal law, and the reforms of public education. The law of the 30th of June 1881, established the right of holding meetings. Public meetings, whether for ordinary or electoral purposes, may be held without preliminary authorization; the law of 1881 prescribed a declaration made by a certain number of citizens enjoying full civil and political rights, which is now remitted. The only really restrictive provision is that which does not allow them to be held in the public highway, but only in an enclosed space. But this is made necessary by the customs of France. The law of the 21st of July 1881 on the press is one of the most liberal in the world. By it all offences committed by any kind of publication are submitted to a jury; the punishment for the mere expression of obnoxious opinions is abolished, the only punishment being for slander, libel, defamation, inciting to crime, and in certain cases the publication of false news. The law of the 1st of July 1901 established in France the right of forming associations. It recognizes the legality of all associations strictly so called, the objects of which are not contrary to law or to public order or morality. On condition of a simple declaration to the administrative authority, it grants them a civil status in a wide sense of the term. Religious congregations, on the contrary, which are not authorized by a law, are forbidden by this law. This was not a new principle, but the traditional rule in France both before and after the Revolution, except that under certain governments authorization by decree had sufficed. As a matter of fact the unauthorized congregations had been tolerated for a long time, although on various occasions, and especially in 1881, their partial dissolution had been proclaimed by decrees. The law of 1901 dissolved them all, and made it an offence to belong to such a congregation. The members of unauthorized congregations, and later, in 1904, even those of the authorized congregations, were disqualified from teaching in any kind of establishment. The liberty of primary education was confirmed and reorganized by the law of the 30th of October 1886, which simply deprived the clergy of the privileges granted them by the law of 1850, though the latter remains in force with regard to the liberty of secondary education. A law passed by the National Assembly (July 12, 1875) established the liberty of higher education. It even went beyond this, for it granted to students in private faculties who aspired to state degrees the right of being examined before a board composed partly of private and partly of state professors. The law of the 18th of March 1880 abolished this privilege. Another law, that of the 22nd of March 1882, made primary education obligatory, though allowing parents to send their children either to private schools or to those of the state; the law of the 16th of June 1881 established secular (laïque) education in the case of the latter. The Third Republic also organized secondary education for girls in lycées or special colleges (collèges de fille). Finally, a law of the 20th of July 1866 dealing with higher education and the faculties of the state reorganized the universities, which form distinct bodies, enjoying a fairly wide autonomy. A law of the 10th of December 1895, abolishing that of the 18th Germinal in the year X, which had sanctioned the Concordat, proclaimed the separation of the church from the state. It is based on the principle of the secular state (état laïque) which recognizes no form of religion, though respecting the right of every citizen to worship according to his beliefs, and it aimed at organizing associations of citizens, the object of which was to collect the funds and acquire the property necessary for the maintenance of worship, under the form of associations cultuelles, differing in certain respects from the associations sanctioned by the law of the 1st of July 1901, but having a wider scope. It also handed over to these regularly formed associations the property of the ecclesiastical establishments formerly in existence, which taking provision of the property of the law, abolished and the associations the freedom to choose the places of worship belonging to the state, the departments or the communes. If no association cultuelle was founded in a parish, the property of the former fabrique should devolve to the commune. But this law was condemned by the papacy, as contrary to the church hierarchy; and almost nowhere were associations cultuelles formed, except by Protestants and Jews, who complied with the law. After many incidents, but no church having been closed, a new law of the 2nd of January 1907 was enacted. It permits the public exercise of any cult, by means of ordinary associations regulated by the law of the 1st of July 1901, and even of public meetings summoned by individuals. Failing all associations, either cultuelles or others, churches, with their ornaments and furniture, are left to the disposition of the faithful and ministers, for the purpose of exercising the cult; and, on certain conditions, the long use of them can be granted as a free gift to ministers of the cult.

Among the organic laws concerning administrative affairs there are two of primary importance; that of the 10th of

1 Political Science and Comparative Constitutional Law (Boston, 1896).
August 1871, on the conseils généraux, considerably increased the powers and independence of these elective bodies, which have become important deliberative assemblies, their sessions being held in public. The law of 1871 created a new administrative organ for the departments, the commission départementale, elected by the council-general of the department from among its own members and associated with the administration of the prefect. The other law is the municipal law of the 5th of April 1884, which effected a widespread decentralization; the maires and their adjoints are elected by the municipal council.

The war of 1870–71 necessarily led to a modification of the military organization. The law of the 25th of July 1872 established the principle of compulsory service for all, first in the standing army, then in the reserve, and finally in the territorial army. But the application of this principle was by no means absolute, only holding good in time of war. Each annual class was divided into two parts, by means of drawing lots, and in time of peace one of these parts had only a year of service with the active army. The previous exemptions, based either on the position of supporter of the family (as in the case of the son of a widower or aged father, &c.) or on equivalent services rendered to the state (as in the case of young ecclesiastics or members of the teaching profession), were preserved, but only held good for service in the active army in times of peace.

Finally, the system of conditional engagement for a year allowed young men, for the purposes of study or apprenticeship to their profession, only to serve a year with the active army in time of peace. By this means it was sought to combine the advantages of an army of veterans with those of a numerous and truly national army. But the conditional volunteering (volontariat conditionnel) for a year was open to too great a number of people, and so brought the system into discredit. As those who profited by it had to be clothed and maintained at their own expense, and the sum which they had to furnish for this purpose was generally fixed at 1,500 francs, it could not be considered the privilege of those who could pay this sum. A new law of the 15th of July 1889 lessened the difference between the two terms which it attempted to reconcile. It reduced the term of service in the active army to three years, and the exemptions, which were still preserved, merely reduced the period to a year in times of peace. The same reduction was also granted to those who were really pursuing important scientific, technical or professional studies; the system was so strict on this point that the number of those who profited by those exemptions did not amount to 2000 a year. This was a compromise between two opposing principles; the democratic principle of equality, being the stronger, was bound to triumph. The law of the 21st of March 1905 reduced the term of service in the active army to two years, but made it equal for all, admitting of no exemption, but only certain facilities to those who at the age at which it had to be accomplished.

In 1873 the南路inal law was reorganized and reduced in number. With the exception of a few modifications the main lines of judicial organization remained the same. In 1879 the conseil d'État was also reorganized. The whole fabric of administrative jurisprudence was carefully organized, and almost entirely separated from the active administration.

The system of taxation has remained essentially unaltered; we may notice, however, the laws of 1807, 1808 and 1900, which abolished or lessened the duties on so-called hygienic drinks (wine, beer, cider), and the financial law of 1901, which rearranged and increased the transfer fees, and established a system of progressive taxation in the case of succession duties. The labour laws, which generally partook of the nature both of public and of private law, are a sign of our times. Under the Third Republic they have been numerous, the most notable being: the law of the 21st of March 1884 on professional syndicates, which introduced the liberty of association in matters of this kind before it became part of the common law (see TRADE Unions);

the law of the 9th of April 1898 on the liability for accidents incurred during work, and those which have completed it; that of the 22nd of December 1892 on conciliation and arbitration in the case of collective disputes between employers and workmen; that of the 29th of June 1893 on the hygiene and safeguarding of workers in industrial establishments, and the laws which regulate the work of children and women in factories; finally, that of the 15th of July 1893 on free medical attendance (see LABOUR LEGISLATION).

As to criminal law, there have been more than fifty enactments, mostly involving important modifications, due to more scientific ideas of punishment, so that we may say that it has been almost entirely recast since the establishment of the Third Republic. The separate system applied in cases of preventive detention and imprisonment for short periods; libration before the expiry of the term of sentence, subject to the condition that no fresh offence shall be committed within a given time; transportation to the colonies of habitual offenders; the remission of the penalty in the case of first offenders, and the lapsing of the penalty when a certain time has gone by without a fresh condemnation; greater facilities for the rehabilitation of condemned persons, which now become simply a matter for the courts, and occurred as a matter of course at the end of a certain time; such were the chief results of this legislation. Finally, the law of the 8th of December 1897 completely altered the form of the preliminary examination before the juge d'instruction, which had been the weakest point in the French criminal procedure, though it was still held in private; the new law made this examination really a hearing of both sides, and made the appearance of counsel for the defence practically compulsory.

As to private law, both civil and commercial, we could enumerate between 1871 and 1906 more than a hundred laws which have modified it, sometimes profoundly, and have for the most part done very useful work without attracting much attention. The changes have been generally drawn up by commissions of competent men, and pass both chambers almost without discussion. There have, however, been a few which aroused public interest and even deep feeling. Firstly, there was the law of the 27th of July 1884, and those which completed it; this law re-established divorce, which had been abolished since 1816, but only permitted it for certain definite causes determined by law. On the other hand, the law of the 6th of February 1893 increased the liberty and independence of a woman who was simply judicially separated, in order to encourage separation, as opposed to divorce, when the conditions allowed it. The law of the 25th of March 1896 on the succession of illegitimate children, who were recognized by the parents, treated them not in the same way as legitimate children, but gave them the title of heirs in the succession of their father and mother, together with much greater rights than they had possessed under the Code Civil. The law of the 24th of July 1899, on the protection of children who are ill-treated or morally neglected, also modified some of the provisions of the law as applied to the family, with a view to greater justice and humanity. Finally, on the occasion of the centenary of the Code Civil (see CODE NAPOLEON), a commission, composed of members of the chambers, magistrates, professors of law, lawyers, political writers, and even novelists and dramatic authors, was given the task of revising the whole structure of the code.

FRANCESCHI—FRANCESCHINI

FRANCESCHI, JEAN BAPTISTE, BARON (1756–1813), French general, was born at Bastia on the 9th of December 1756 and entered the French service in 1773. He took part in the operations in Corsica in the following year, and received a wound at the siege of San Fiorenzo. After this he left the island and was appointed a field officer in the French Army of Italy, with which he served from 1775 to 1799. He served as a general officer in the campaign of Marengo, in the Naples campaign of 1805–1806, and in the Peninsular War from 1807 to 1809. He was created a baron by Napoleon. He commanded a Neapolitan brigade in the Russian War of 1812, and after the retreat from Moscow took refuge, with the remnants of his command, in Danzig, where in the course of the siege of 1813 he died on the 19th of March.

Two other generals of brigade in Napoleon's wars bore the name of Franceschi, and the three have often been mistaken for each other. The first was born at Lyons, JEAN BAPTISTE MARIE FRANCESCHI-DELONNE (1757–1810), who served throughout the Revolutionary campaign on the Rhine, took part in the campaign of Zürich in 1799, and distinguished himself very greatly by his escape from, and subsequent return to, Genoa, when in 1800 Masséna was closely besieged in that city. He was appointed to the command of the 1st Neapolitan column, and led it to victory at the battle of Austerlitz, and served in southern Italy and in Spain on the staff of King Joseph Bonaparte. During the Peninsular War he won great distinction as a cavalry general, and in 1810 Napoleon made him a baron. At this time he was a prisoner in the hands of the Spaniards, into whose hands he had fallen while bearing important despatches during the campaign of Talavera. He was harshly treated by his captors, and died at Carthagena on the 23rd of October 1810. The second was FRANÇOIS FRANCESCHI-LOSIO (1770–1810), born at Milan, who entered the French Revolutionary army in 1795. He served through the Italian campaign of 1796–97, and subsequently, like Franceschi-Delonne, with Masséna at Zürich and at Genoa, and at the headquarters of King Joseph in Italy and Spain. He was killed in a duel by the Neapolitan colonel Filangieri in 1810.

FRANCESCHI, PIERO (of PIETRO) DE' (c. 1416–1492), Italian painter of the Umbrian school. This master is generally named Piero della Francesca (Peter, son of Francesca), the tradition being that his father, a woolen-draper named Benedetto, had died before he was born. This was not the case; yet another mistake in naming; the father's name was Romano, and the father continued living during many years of Piero's career. The painter is also named Piero Borghese, from his birthplace, Borgo San Sepolcro, in Umbria. The true family name was, as above stated, Franceschi, and the family still exists under the name of Martini-Franceschi.

Piero first received a scientific education, and became an adept in mathematics and geometry. This early bent of mind and course of study influenced to a large extent his development as a painter. He had more science than either Paolo Uccello or Mantegna, both of them his contemporaries, the former older and the latter younger. Skilful in linear perspective, he fixed rectangular planes in perfect order and measured them, and thus got his figures in true proportional height. He preceded and excelled Domenico Ghirlandajo in projecting shadows, and rendered with considerable truth atmosphere, the harmony of colours, and the relief of objects. He was naturally therefore excellent in architectural painting, and, in point of technique, he advanced the practice of oil-colouring in Italy.

The earliest trace that we find of Piero as a painter is in 1439, when he was an apprentice of Domenico del Greco, and assisted him in painting the chapel of S. Egidio, in S. Maria Novella of Florence. Towards 1450 he is said to have been with the same artist in Loreto; nothing of his, however, can now be identified in that locality. In 1451 he was by himself, painting in Rimini, where a fresco still remains. Prior to this he had executed some extensive frescoes in the Vatican; but these were destroyed when Raphael undertook on the same walls the "Liberation of St Peter" and other paintings. His most extensive extant series of frescoes is in the choir of S. Francesco in Arezzo,—the "History of the Cross," beginning with legendary subjects of the death and burial of Adam, and going on to the entry of Hesychius into Jerusalem after the overthrow of Chosroes. This series is in relation to its period, remarkable for effect, movement, and mastery of the nude. The subject of the "Vision of Constantine" is particularly vigorous in its design; and a preparatory design of the same composition was so highly effective that it used to be ascribed to Giorgione, and might even (according to one authority) have passed for the handiwork of Correggio or of Rembrandt. A noted fresco in Borgo San Sepolcro, the "Resurrection," may be later than this series; it is preserved in the Palazzo de' Conservatori. An important painting of the "Flagellation of Christ," in the cathedral of Urbino, is later still, probably towards 1470. Piero appears to have been much in his native town of Borgo San Sepolcro from about 1445, and more especially after 1454, when he finished the series in Arezzo. He grew rich there, and there he died, and in October 1492 was buried.

Two statements made by Vasari regarding "Piero della Francesca" are open to much controversy. He says that Piero became blind at the age of sixty, which cannot be true, as he continued painting until 1492. It is also said that Piero was the student of Baldessare Pavoni, but this is incorrect. He was instead the student of Domenico Ghirlandajo, who was his teacher. Pierre was a student of Domenico Ghirlandajo, who was his teacher.

Another work, a profile of Isotta da Rimini, may safely be rejected. The "Baptism of Christ," which used to be the altarpiece of the Priest of the Baptist in Borgo San Sepolcro, is an important example; and still more so the "Nativity," with the Virgin kneeling, and five angels singing to musical instruments. This is a very interesting and characteristic specimen, and has indeed been praised somewhat beyond its desirability on aesthetic grounds.

Piero's earlier style was energetic but refined, and to the last he lacked selectness of form and feature. The types of his visages are peculiar, and the costumes (as especially in the Arezzo series) striking. He used to select his forms from clay models swathed in real drapery. Luca Signorelli was his chief teacher, and especially to some extent Perugino; and his own influence, furthered by that of Signorelli, was potent over all Italy. Belonging as he does to the Umbrian school, he united with that style something of the Sienese and more of the Florentine work. Besides Vasari and Crowe & Cavalcaselle, the work by W. G. W. Waters, "Piero della Francesca" (1899) should be consulted.

(1811–1868), Italian painter of the Tuscan school, named, from Volterra the place of his birth, Il Volterrano, or (to distinguish him from Ricciarelli) II Volterrano Giuniore, was the son of a sculptor in alabaster. At a very early age he learned from Cosimo Daddi some of the elements of art, and he started as an assistant to his father. This employment being evidently below the level of his talents, the marquises Inghirami placed him, at the age of sixteen, under the Florentine painter Matteo Rosselli. In the ensuing year he had advanced sufficiently to execute in Volterra some frescoes, and in the meantime others, following by other frescoes for the Medici family the Val d'Arno Palace. In 1535 the marchese Filippo Niccolini, being minded to employ him once more, bought from the frescoes for the cupola and back-wall of his chapel in S. Croce, Florence, despatched him to various parts of Italy to perfect his style. The painter, in a tour which lasted some months, took more especially to the qualities distinctive of the schools of Parma and Bologna, and in a measure to those of Pietro da Cortona, whose acquaintance he made in Rome. He then undertook the paintings commissioned by Niccolini, which
constitute his most noted performance, the design being good, and the method masterly. Franceschini ranks higher in fresco than in oil painting. His works in the latter mode were not unfrequently left unfinished, although numerous specimens remain, the cabinet pictures being marked by much sprightliness of invention. Among his best oil paintings of large scale is the "St John the Evangelist" in the church of S. Chiara at Volterra. One of his latest works was the fresco of the cupola of the Annunziata, Florence, which occupied him for two years towards 1683, a production of much labour and energy. Franceschini died of apoplexy at Volterra on the 6th of January 1689. He is reckoned among those painters of the decline of art to whom the general name of "machinist" is applied.

He is not to be confounded with another Franceschini of the same class, and of rather later date, also of no small eminence in his time—the Cavaliere Marcantonio Franceschini (1648-1720), who was a Bolognese.

**Francécomté**, a province of France from 1674 to the Revolution. It was bounded on the E. by Switzerland, on the S. by Bresse and Bugey, on the N. by Lorraine, and on the W. by the duchy of Burgundy and by Bassigny, embracing on the E. of the Jura the valley of the Saône and most of that of the Doubs. Under the Romans it corresponded to *Maxima Sequanorum*, and after having formed part of the kingdom of Burgundy was in the early Middle Ages the seat of the countships of Portus, Bassigny, Amos and Escuin. In the 10th century these four countships were united to form a whole, which came to be called the countship of Burgundy, and belonged at that time to the family of the counts of Mâcon.

The limits of the countship were definitely settled under Otto William, son of Albert or Adalbert, king of Italy (1027), who on the death of his father-in-law, Henry (1002), tried to seize the duchy of Burgundy, but without success. The countship, which formed a fief dependent on the kingdom of Burgundy, passed to Renaud I., the second son of Otto William. When the kingdom of Burgundy was united to the Germanic empire, he refused to pay homage to the emperor Henry III., whose suzerainty over him never existed except in theory. William I., surnamed the Great or Headstrong (1059-1087), still further added to the power of his house by marrying Etienne, heiress of the count of Vienne, and by acquiring from his cousin Guy, when the latter became a monk at Cluny, the countship of Mâcon. One of his sons, Guy, became pope, under the name of Calixtus II. His grandson, Renaud III. (1067-1148), in his turn refused to pay homage to the emperor Lothair, who retaliated by confiscating his domains and giving them to Conrad of Zähringen. Renaud, however, succeeded in maintaining until his death his possession of the countships of Burgundy, Vienne and Mâcon. He left as sole heiress a daughter, Beatrix, whom his brother William III. imprisoned, in order to make an attempt on her inheritance; she was set free, however, by the emperor Frederick Barbarossa, who married her in 1156.

On the death of Beatrix (1185) the countship of Burgundy passed to Otto I. (1190-1200), the youngest but one of her sons, who had to dispute its possession with Stephen, count of Auxonne, the grandson of William III. Beatrix, the daughter and heiress of Otto I. (1200-1231), married Otto, duke of Meran (1234), under whose government the inhabitants of Besançon, who had since been the time of Frederick Barbarossa an imperial city, formed themselves definitely into a commune. Alix, daughter of Beatrix and of Otto of Meran, and heiress to the countship of Burgundy, married Hugh of Chalon, son of John the Ancient or the Wise (d. 1248), and a descendant of William I. and consequently of William the Headstrong, thus bringing the countship back into the family of its former lords. His son Otto IV. (1270-1303) engaged in war against the bishop of Basel, and the German king Rudolph I., who supported the latter, entered Francécomté and besieged Besançon, but without success (1286). Otto, in fulfilment of the treaties of Ervannes and Vincennes (1290-1295) gave Jeanne, his daughter by Mahaut of Artois, in marriage to Philip, count of Poitiers, son of Philip the Fair. The latter took over the administration of the countship in spite of strong opposition from the nobles of the country, but their leader, John of Chalon-Arlay, was compelled to make his submission. Another of Otto's daughters married Charles IV., the Handsome, and both princesses, together with their sister-in-law Margaret of Burgundy, were concerned in the celebrated trial of the Tour de Nesle. Jeanne, however, continued to govern her countship when Philip his husband became king of France (Philip V., "the Long"). Jeanne, her daughter and heiress, married Odo IV., duke of Burgundy (1330-1347), and her sister Margaret became the wife of Louis II., count of Flanders. The countship returned to Margaret at the death of Odo IV., who was succeeded in his duchy by his grandson Philip of Rouvres.

The marriage of Philip the Bold with Margaret, daughter of Louis of Male, caused Francécomté to pass to the princes of the ducal house of Burgundy, who kept it up till the death of Charles the Bold (1477). On his death Louis XI. laid claim to the government of the countship as well as of the duchy, as trustee for the property of the princess Mary, who was closely related to him and destined to marry the dauphin (later Charles VIII.). French garrisons occupied the principal towns, and the lord of Craon was appointed governor of the country. In consequence of his severity there was a general rising, and at the same time Mary married Maximilian, archduke of Austria, to whom her father had formerly promised her (Aug. 1477). The war ended in a truce from February to May (1479), but was beaten by the people of Dôle. Charles of Amboise, who took his place, reconquered the province, and even Besançon submitted to the authority of the king of France, who promised to respect its privileges.

On the death of Louis XI. (1483), the estates of Francécomté recognized as sovereign his son Charles, who was betrothed to the little Margaret of Burgundy, daughter of Maximilian and Mary (d. 1482), but when Charles VIII. refused Margaret's hand in order to marry Anne of Brittany there was a fresh rising, and the French were again driven out. The treaty of Senlis (23rd May 1483) put an end to the struggle: Charles abandoned all his pretensions, and Maximilian was thus left in possession of Francécomté, the sovereignty of which he handed on to his son Philip and ultimately to the crown of Spain. He had, however, constituted his daughter Margaret sovereign-governess of Francécomté for life, and under the administration of this princess (who died in 1530), as under the rule of Charles V., the country enjoyed comparative independence, paying a "don gratuit" of 200,000 livres every three years, and being actually governed by the parliament of Dole, and by governors chosen from the nobility of the country. It was Francécomté which furnished Philip II. of Spain with one of his best counsellors, Cardinal Perrenot de Granvelle.

In the 16th century the country was disturbed by the preaching of Protestant doctrines, which gained adherents especially in the district of Montbéliard, and later by the wars between France and Spain. In 1505 the armies of Henry IV. levied contributions on Besançon and other towns; but the people of Francécomté succeeded in obtaining special terms of neutrality in order to shelter themselves from injury from either of the parties in the war, and enjoyed a period of calm under the government of the infanta Isabella Clara Eugénie and the archduke Albert (1590-1621). But the country suffered greatly from the ravages of the Thirty Years' War, from the presence of the army of the Condé, which besieged Dôle, from the devastation of the troops of Gallas, and later of those of Bernard of Saxe-Weimar. The peace of Westphalia (1648) confirmed Spain in the possession of Francécomté. In 1668 the French again entered it, and the conquest, of which the foundations had been laid by the intrigues of the abbot of Watteville and the French party constituted by him, was easily accomplished by Condé and Luxembourg. Louis XIV. directing the army in Francécomté for some time in person. None the less, the country was restored to Spain at the peace of Aix-la-Chapelle (1668), but in 1674 Louis headed another expedition there. Besançon capitulated after a siege of twenty-seven days, and Dôle and Salins also fell into the hands of the invaders.
In 1678 the treaty of Nijmegen gave Franché-Comté to France (the principality of Montbéliard remaining in the possession of the house of Württemberg, which had acquired it by marriage) and thus celebrated the fact that the Arc de Triomphe of the Portes Saint Denis and Saint Martin at Paris was erected. Franché-Comté became a military government (gouvernement). The estates ceased to meet, and the old “don gratuit” was replaced by a tax which became increasingly heavy. Louis made Besançon, which Vauban fortified, into the capital of the province, and transferred to it the parliament and the university, the seat of which had hitherto been Dôle. For purposes of administration, the county was divided among the four great bailliages of Besançon, Dôle, Amont (chief town Vesoul) and Aval (chief town Salins). At the Revolution were formed from it the departments of Jura, Doubs and Haute-Saône.

See Dunod, Histoire des Seguans; Hist. du comté de Bourgogne (Dijon, 1735-1749); E. Clerc, Études sur l'histoire de la Franche-Comté (2nd ed., Besançon, 1870). (R. Po.)

FRANCHISE (from O. Fr. franchie, freedom, franc, free), in English law, a royal privilege or branch of the crown's prerogative subsisting in the hands of a subject. A franchise is an incorporeal hereditament, and arises either from royal grants or from prescription which presupposes a grant. Such franchises are bodies corporate, the right to hold a fair, market, ferry, free fishery, &c. The term is also applied to the right of voting at elections and the qualifications upon which that right is based (see Registration; Representation; Vote). In the United States the term is especially applied to the right or powers of partial appropriation of public property by exclusive use, or to a privilege of a public nature conferred on a corporation created for the purpose.

FRANCIA (c. 1430–1517), a Bolognese painter, whose real name was Francesco Raibolini, his father being Marco di Giacomo Raibolini, a carpenter, descended from an old and creditable family, was born at Bologna about 1450. He was apprenticed to a goldsmith currently named Fracia, and from him probably he got the nickname whereby he is generally known; he moreover studied under Marco Zoppo. The youth was thus originally a goldsmith, and also an engraver of dies and niello, and in these arts he became extremely eminent. He was particularly famed for his dies for medals; he rose to be mint-master at Bologna, and retained that office till the end of his life. A famous medal of Pope Julius II. as liberator of Bologna is ascribed to his hand, but not with certainty. As a type-founder he made for Aldus Manutius the first italic type.

At a mature age—having first, it appears, become acquainted with Mantegna—he turned his attention to painting. His earliest known picture is dated 1504 (not 1499, as ordinarily stated). It shows so much mastery that one is compelled to believe that Raibolini must have been thereat practised painting for some few years. This work is now in the Bologna gallery—the “Virgin enthroned, with Augustine and five other saints” is a full picture, and was originally painted for the church of S. Maria della Misericordia, at the desire of the Bentivoglio family, the rulers of Bologna. The same patrons employed him upon frescoes in their own palace; one of “Judith and Holofernes” is especially noted, its style recalling that of Mantegna. Fracia probably studied likewise the works of Perugino; and he became a friend and ardent admirer of Raphael, to whom he addressed an enthusiastic sonnet. Raphael cordially responded to the Bolognese master’s admiration, and said, in a letter dated in 1508, that few painters or none had produced Madonnas more beautiful, more devout, or better portrayed than those of Fracia.

If we may trust Vasari—but it is difficult to suppose that he was entirely correct—the exceeding value which Fracia set on Raphael’s art brought him to his grave. Raphael had consigned to Fracia his famous picture of “St Cecilia,” destined for the church of S. Giovanni in Monte, Bologna; and Fracia, on inspecting it, took so much to heart his own inferiority, at the advanced age of about sixty-six, to the youthful Umbran, that he sickened and shortly expired on the 6th of January 1517.

A contemporary record, after attesting his pre-eminence as a goldsmith, jeweller and painter, states that he was “most handsomely dressed and spoken of” among the gentlemen of the town.

Distanced though he may have been by Raphael, Fracia is rightly regarded as the greatest painter of the earlier Bolognese school, and hardly to be surpassed as representing the art termed “antico-moderno,” or of the “quattrocento.” It has been well observed that his style is a medium between that of Perugino and that of Giovanni Bellini; he has somewhat more of spontaneous naturalism than the former, and of abstract dignity in feature and form than the latter. The magnificent portrait in the Louvre of a young man in black, of brooding thoughtfulness and saddened profundity of mood, would alone suffice to place Fracia among the very great masters, if it could with confidence be attributed to his hand, but in all probability its real author was Frangibigio; it had erewhile passed under the name of Raphael, of Giorgione, or of Sebastian del Piombo. The National Gallery, London, contains two remarkably fine specimens of Fracia, once combined together as principal picture and lunette,—the “Virgin” and “Child and St Anna,” adorned, surrounded by saints and (in the lunette) the “Pietà,” or lamentation of angels over the dead Saviour. They come from the Buonvisi chapel in the church of S. Frediano, Lucca, and were among the master’s latest paintings. Other leading works are—in Munich, the “Virgin” sinking on her knees in adoration of the Divine Infant, who is lying in a garden within a rose trellis; in the Borghese gallery, Rome, a Peter Martyr; in Bologna, the frescoes in the church of St Cecilia, illustrating the life of the saint, all of them from the design of Raibolini, but not all executed by himself. His landscape backgrounds are of uncommon excellence. Fracia had more than 200 scholars. Marcanziono Raimondi, the famous engraver, is the most renowned of them; next to him Amico Aspertini, and Fracia’s own son Giacomo, and his cousin Julio. Lorenzo Costa was much associated with Fracia in pictorial work.

Among the authorities as to the life and work of Fracia may be mentioned G. Calvi, Franchi, Franchi, Franchi (1813), and especially G. C. Williamson, Francia (1900). (W. M. R.)

FRANCIA, JOSÉ GASPAR RODRIGUEZ (c. 1757–1840), dictator of Paraguay, was born probably about 1757. According to one account he was of French descent; but the truth seems to be that his father, Garcia Rodriguez Francia, was a native of S. Paulo in Brazil, and came to Paraguay to take charge of a plantation of black tobacco for the government. He studied theology at the college of Cordova de Tucuman, and is said to have been for some time a professor in that faculty; but he afterwards turned his attention to the law, and practised in Asuncion. Having attained a high reputation at once for ability and integrity, he was selected for various important offices. On the declaration of Paraguayan independence in 1811, he was appointed secretary to the national junta, and exercised an influence on affairs greatly out of proportion to his nominal position. When the congress or junta of 1813 changed the constitution and established a duumvirate, Dr Francia and the Gaucho general Vegres were elected to the office. In 1814 he secured his own election as dictator for three years, and at the end of that period he obtained the dictatorship for life. In the accounts which have been published of his administration we find a strange mixture of capacity and caprice, of far-sighted wisdom and reckless infatuation, strenuous endeavours after a high ideal and flagrant violations of the simplest principles of justice. He put a stop to the foreign commerce of the country, but carefully fostered its internal industries; was disposed to be hospitable to strangers from other lands, and kept them prisoners for years; lived a life of republican simplicity, and punished with Dionysian severity the slightest want of respect. As time went on he appears to have grown more arbitrary and despotic. Deeply imbued with the principles of the French Revolution, he was a stern antagonist of the church. He abolished the Inquisition, suppressed the college of theology, did away with the tithes, and inflicted endless indignities on the priests. He discouraged marriage
both by precept and example, and left behind him several illegitimate children. For the extravagances of his later years the plea of insanity has been put forward. On the 26th of September 1840 he was seized with a fit and died.

The first and fullest account of Dr Francia was given to the world by two Swiss surgeons, Renger and Longchamp, whom he had detained in Paraguay from 1830 to 1835—"Essai historique sur la révolution de Paraguay et le gouvernement dictatorial du docteur Francia" (Paris, 1837). Their work was almost immediately translated into English under the title of The Reign of Doctor Joseph G. R. De Francia in Paraguay (1837). But their account, so favourable a notice of his character, was greatly weakened by the dictator's interference. The account which they gave of his character and government was of the most unfavourable description, and they rehearsed and emphasized their accusations in Francia's Reign of Terror (1839) and Letters on South America (3 vols., 1843). From the very pages of their detractors Thomas Carlyle succeeded in extracting materials for a brilliant defence of the dictator "as a man or sovereign of iron energy and industry, of great and severe labour." It appeared in the Foreign Quarterly Review for 1843, and is reprinted in his Critical and Miscellaneous Essays. Sir Richard F. Burton gives a graphic sketch of Francia's life and a favourable notice of his character in his Letters from the Battlefields of Paraguay (1870), while C. A. Washburn takes up a hostile position in his History of Paraguay (1871).

FRANCIABIGIO (1482–1523), Florentine painter. The name of this artist is generally given as Mercantonio Franziabigio; it appears, however, that his only real ascertained name was Francesco di Cristofano; and that he was currently termed Fra Bigio, the two appellatives being distinct. He was born in Florence, and studied under Albertinelli for some months. In 1505 he formed the acquaintance of Andrea del Sarto; and after a while the two painters set up a shop in common in the Piazza del Grano. Franziabigio paid much attention to anatomy and perspective, and to the proportions of his figures, though these are often too squat and puffy in form. He had a large stock of artistic knowledge, and was at first noted for diligence. As years went on, and he received frequent commissions for all sorts of public painting for festive occasions, his diligence merged in something which may rather be called workmanly offhandedness. He was particularly proficient in fresco, and Vasari even says that he surpassed all his contemporaries in this method of painting which was much in vogue at that time. In 1511, when he was in the Servites (or cloister of the Annunziata) in Florence he painted in 1513 the "Marriage of the Virgin" as a portion of a series wherein Andrea del Sarto was chiefly concerned. The friars having uncovered this work before it was quite finished, Franziabigio was so incensed that, seizing a mason's hammer, he struck at the head of the Virgin, and some other heads; and the fresco, which would otherwise be his masterpiece in that method, remains thus mutilated. At the Scalo, in another series of frescoes on which Andrea was likewise employed, he executed in 1518–1520 the "Departure of John the Baptist for the Desert," and the "Meeting of the Baptist with Jesus"; and, at the Medici palace at Poggio a Caiano, in 1521, the "Triumph of Cicerone." Various works which have been ascribed to Raphael are now known or reasonably deemed to be by Franziabigio. Such are the "Madonna del Pozzo," in the Uffizi Gallery; the half figure of a "Young Man," in the Louvre (see also Francia); and the famous picture in the Fuller-Maitland collection, a "Young Man" which has comparatively little in style to another in the Pitti gallery, avowedly by Franziabigio, a "Youth at a Window," and to some others which bear this painter's recognized monogram. The series of portraits, taken collectively, placed beyond dispute the eminent and idiosyncratic genius of the master. Two other works of his, of some celebrity, are the "Calumny of Apelles," in the Pitti, and the "Bath of Bathsheba" (painted in 1523), in the Dresden Gallery.

FRANCIS (Lat. Franciscus, Ital. Francesco, Span. Francisco, Fr. François, Ger. Franz), a masculine proper name meaning "Frenchman." As a Christian name it originated with St Francis of Assisi, whose baptismal name was Giovanni, but who was called Francesco by his father on returning from a journey in France. The saint's name made the name exceedingly popular from his day onwards.

FRANCIS I. (1708–1765), Roman emperor and grand duke of Tuscany, second son of Leopold Joseph, duke of Lorraine, and his wife Elizabeth Charlotte, daughter of Philip, duke of Orleans, was born on the 8th of December 1708. He was connected with the Habsburgs through his grandmother Eleanore, daughter of the emperor Ferdinand III., and wife of Charles Leopold of Lorraine. The emperor Charles VI. favoured the family, who, besides being his cousins, had served the house of Austria with distinction. He had designed to marry his daughter Maria Theresa to Clement, the elder brother of Francis. On the death of Clement he adopted the younger brother as his husband. Francis was brought up at Vienna with Maria Theresa on the understanding that they were to be married, and a real affection arose between them. At the age of fifteen, when he was brought to Vienna, he was established in the Silesian duchy of Teschen, which had been mediatized and granted to his father by the emperor in 1722. He succeeded his father as duke of Lorraine in 1729, but the emperor, at the end of the Polish War of Succession, determined to compensate his candidate Stanislas Leszczynski for the loss of his crown in 1735, persuaded Francis to exchange Lorraine for the reversion of the grand duchy of Tuscany. On the 12th of February 1736 he was married to Maria Theresa, and they went for a short time to Florence, where he succeeded to the grand duchy in 1737 on the death of John Gaston, the last of the ruling house of Medici. His wife secured his election to the Empire on the 13th of September 1745, in succession to Charles VII., and she made him co-regent of her hereditary dominions. Francis was well content to leave the reality of power to his able wife. He had a natural fund of good sense and some business capacity, and was a useful assistant to Maria Theresa in the laborious task of governing the complicated Austrian dominions, but his functions appear to have been of a purely secretarial character. He died suddenly in his carriage while returning from the opera at Innsbruck on the 18th of August 1765.

See A. von Arneth, Geschichte Maria Theresias (Vienna, 1863–1879).

FRANCIS II. (1768–1835), the last Roman emperor, and, as Francis I., first emperor of Austria, was the son of Leopold II., grand-duke of Tuscany, afterwards emperor, and of his wife Maria Louisa, daughter of Charles III. of Spain. He was born at Florence on the 12th of February 1768. In 1784 he was brought to Vienna to complete his education under the eye of his uncle the emperor Joseph II., who was childless. Joseph was repelled by the frigid and retiring character of his nephew, and is said to have treated him with an impatient contempt which confirmed his natural timidity; but after the marriage of Francis to Elizabeth of Württemberg (1788) their relations improved. At the close of his uncle's reign he saw some service in the ill-conducted war with Turkey, and kept a careful diary of his experiences. The death of his wife in childbirth on the 18th of February 1790 was followed by the death of his uncle on the 20th; and Francis acted as regent with Prince Kaunitz until his father came from Florence. On the 19th of September he married his first cousin Maria Theresa, daughter of Ferdinand, king of Naples, by whom he was the father of his successor, Francis I., and of Maria Louisa, wife of Napoleon, and of the archduke Francis, father of the emperor Francis Joseph. After her death (1807) he married Maria Ludovica Beatriz of Este (1808), and when she died he made a fourth marriage with Carolina Augusta of Bavaria (1816).

He succeeded to the Austrian dominions and the empire on the death of his father on the 1st of March 1792. The position was a trying one for a young prince twenty-four years of age. The dominions of the house of Austria, widely scattered in the Low Countries, Germany and Italy, were exposed to the attacks of the French revolutionary governments and of Napoleon. He was dragged into all the coalitions against France, and in the early days of his reign he had to guard against the ambition of Prussia, and the aggressions of Russia in Poland and Turkey.
FRANCIS I. OF FRANCE

For long he had no adviser save such diplomatists as Prince Kaufnitz and Thugut, who had been trained in the old Austrian diplomacy. His own best quality was an invincible patience sustained by a rejection on the loyalty of his subjects, and a sense of his duty to the state. (For the general events of this reign till 1815 see EUROPE, AUSTRIA, NAPOLEON, FRENCH REVOLUTIONARY WARS, &c.) The emperor's firmness averted what would have been an irreparable loss of possession. Seeing that the Empire was in the last stage of dissolution, and that, even were it to survive, it would pass from the house of Habsburg to that of Bonaparte, he in 1804 assumed the title of hereditary emperor of Austria. The object of this prudent measure was double. In the first place, he guarded against the danger that his house should sink to a lower rank than the Russian or the French. In the second place, he gave some semblance of unity to his complex dominions in Germany, Bohemia, Hungary and Italy, by providing a common title for the supreme ruler. His action was justified when, in 1806, the establishment of the Confederation of the Rhine forced him to abdicate the empty title of Holy Roman emperor.

In 1809 he made an important change in the working of his administration. He had hitherto been assisted by a cabinet minister who was in direct relation with all the “chanceries” and boards which formed the executive government, and who acted as the channel of communication between them and the emperor, and was in fact a prime minister. In 1809 Napoleon imposed the removal of Count Collaredo, who held the post. From that time forward the emperor Francis acted as his own prime minister, superintending every detail of his administration. In foreign affairs after 1809 he reposed full confidence in Prince Metternich. But Metternich himself declared at the close of his life that he had sometimes held Europe in the palm of his hand, but never Austria. Francis was sole master, and it entitled to whatever praise is due to his government. It follows that he must bear the blame for its errors. The history of the Austrian empire under his rule and since his death bears testimony to both his merits and his limitations. His indomitable patience and loyalty to his inherited task enabled him to triumph over Napoleon. By consenting to the marriage of his daughter, Marie Louise, to Napoleon in 1810, he gained a respite which he turned to good account. By following the guidance of Metternich in foreign affairs he was able to intervene with decisive effect in 1813. The settlement of Europe in 1815 left Austria stronger and more compact than she had been in 1792, and that this was the case was largely due to the emperor.

During the twenty years which preceded his death in 1835, Francis continued to oppose the revolutionary spirit. He had none of the mystical tendencies of the tsar Alexander I., and only adhered to the half fantastic Holy Alliance of 1815 out of pure politeness. But he was wholly in sympathy with the policy of “repression” which came, in popular view, to be identified with the Holy Alliance; and though Metternich was primarily responsible for the part played by Austria in the “policing” of Europe, Francis cannot but be held personally responsible for the cruel and impolitic severities, associated especially with the sinister name of the fortress prison of the Spielberg, which made so many martyrs to freedom. It is not surprising that Francis was denounced by Liberals throughout Europe as a tyrant and an obscurantist. But though at home, as abroad, he met all suggestions of innovation by a steady refusal to depart from old ways, he was always popular among the mass of his subjects, who called him “our good Kaiser Franz.” In truth, if in the spirit of the traditional Landeswasser he chastised his disobedient children mercilessly, he was essentially a well-meaning ruler who forwarded the material and moral good of his subjects according to his lights. But he held that, by the will of God, the whole sovereign authority resided in his person, and could not be shared with others without a dereliction of duty on his part and disastrous consequences; and his capital error as a ruler of Austria was that he persisted in maintaining a system of administration which depended upon the indefatigable industry of a single man, and was entirely outgrown by the modern development of his subjects. Before his death, government in Austria was almost choked, and it broke down under a successor who had not his capacity for work. Like his ancestor Philip II. of Spain, Francis carried caution, and a disposition to sleep upon every possible proposal, to a great length. He died on the 2nd of March 1835.

See Baron J. A. Helfert, Kaiser Franz und die österreichischen Befreiungs-Kriege (Vienna, 1867). Ample bibliographies will be found in Krones von Marchland’s Grundriss der österreichischen Geschichte (Berlin, 1882).

FRANCIS I. (1494—1547), king of France, son of Charles of Valois, count of Angoulême, and Louise of Savoy, was born at Cognac on the 12th of September 1494. The count of Angoulême, who was the great-grandson of King Charles V., died in 1496, and Louise watched over her son with passionate tenderness. On the accession of Louis XII. in 1498, Francis became heir-presumptive. Louise invested him with the duchy of Valois, and gave him as tutor Marshal de Gié, and, after Gié's disgrace in 1503, the sieur de Boisy, Artus Gouffer. François de Rochefort, abbott of St Mesmin, instructed Francis and his sister Marguerite in Latin and history; Louise herself taught them Italian and Spanish; and the library of the château at Amboise was well stocked with romances of the Round Table, which exalted the lad’s imagination. Francis showed an even greater love for violent exercises, such as hunting, which was his ruling passion, jousts and for tournaments, masquerades and amusements of all kinds. His earliest gallantries are described by his sister in the 25th and 42nd stories of the Héptameron. In 1507 Francis was betrothed to Claude, the daughter of Louis XII., and in 1508 he came to court. In 1512 he gained his first military experience in Guienne, and in the following year he commanded the army of Picardy. He married Claude on the 18th of May 1514, and succeeded Louis XII. on the 1st of January 1515. Of noble bearing, and, in spite of a very long and large nose, extremely handsome, he was a sturdy and valiant knight, affable, courteous, a brilliant talker and a facile poet. He had a sprightly wit, some delicacy of feeling, and some generous impulses which made him amiable. These brilliant qualities, however, were all on the surface. At bottom the man was frivolous, profoundly selfish, unstable, and utterly incapable of consistency or application. The ambassadors remarked his negligence, and his ministers complained of it. Hunting, tennis, jewelry and his gallantry were the chief preoccupations of his life.

His character was at once authoritative and weak. He was determined to be master and to decide everything himself, but he allowed himself to be dominated by every personified. Favourites, too, often good, were credited for him, and played an important part in his reign. His capricious humour elevated and deposed them with the same disconcerting suddenness. In the early years of his reign the conduct of affairs was chiefly in the hands of Louise of Savoy, Chancellor Antoine Duprat, Secretary Florimond Robertet, and the two Gouffiers, Boisy and Bonnivet. The royal favour then elevated Anne de Montmorency and Philippe de Clabot, and in the last years of the reign Marshal d'Annebaud and Cardinal de Tournon. Women too had always a great influence over Francis—his sister, Marguerite d'Angoulême, and his mistresses. Whatever the number of these, he had only two tükular mistresses—at the beginning of the reign Françoise de Châteaubriant, and from about 1526 to his death Anne de Pisseleu, whom he created duchesse d'Étampes and who entirely dominated him. It has not been proved that he was the lover of Diane de Poitiers, nor does the story of “ La belle Ferronnière” appear to rest on any historical foundation.  

Circumstances alone gave a homogeneous character to the foreign policy of Francis. The struggle against the emperor Charles V. filled the greater part of the reign. In reality, the policy of Francis, save for some flashes of sagacity, was irresolute and vacillating. Attracted first by Italy, dreaming of fair feats of prowess, he led the triumphal Marignano expedition, which gained him the title of a knightly king and as the most powerful prince in Europe. In 1519, in spite of wise counsels.

1 On this point see Paulin Paris, Études sur le règne de François I.
he stood candidate for the imperial crown. The election of Charles V. caused an inevitable rivalry between the two monarchs which accentuated still further the light and chivalrous temper of the king and the cold and political character of the emperor. Francis's personal intervention in this struggle was seldom happy. He did not succeed in gaining the support of Henry VIII. of England at the interview of the Field of the Cloth of Gold in 1520; his want of tact goaded the Constable de Bourbon to extreme measures in 1522-1523; and in the Italian campaign of 1522 he proved himself a mediocre, vacillating and foolhardy leader, and by his blundering led the army to the disaster of Pavia (the 25th of February 1525), where, however, he fought with great bravery. “Of all things,” he wrote to his mother after the defeat, “nothing remains to me but honour and life, which is safe”—the authentic version of the legendary phrase “All is lost save honour.” He strove to play the part of royal captive heroicly, but the prison life galmed him. He fell ill at Madrid and was on the point of death. For a moment he thought of abdicating rather than of ceding Burgundy. But this was too great a demand upon his fortitude, and he finally yielded and signed the treaty of Madrid, after having drawn up a secret protest. After Madrid he wavered unconcernedly between two courses, either that of continuing hostilities, or the policy of maintaining the balance of power by the principle of peace and understanding among the powers. At times he had difficulty in realizing the utility of alliances, as was shown by those he concluded with the Porte and with the Protestant princes of Germany. But he could never pledge himself frankly in one sense or the other, and this vacillation prevented him from attaining any decisive results. At his death, however, France was in possession of Savoy and Piedmont.

In his religious policy Francis showed the same instability. Drawn between various influences, that of Margaret of Angoulême, the du Bellays, and the duchesse d'Étampes, who was in favour of the Reformation or at least of toleration, and the contrary influence of the uncompromising Catholics, Duprat, and then Montmorency and de Tournon, he gave pledges successively to both parties. In the first years of the reign, following the counsels of Margaret, he protected Jacques Lefèvre of Étapes and Louis de Berquin, and showed some favour to the new doctrines. But the violence of the Reformers threw him into the arms of the opposite party. The affair of the Placards in 1534 irritated him beyond measure, and determined him to adopt a policy of severity. From that time, in spite of occasional indulgences shown to the Protestant, the desire to conciliate the Protestant powers, Francis gave a free hand to the party of repression, of which the most active and most pitiless member was Cardinal de Tournon; and the end of the reign was sullied by the massacre of the Waldenses (1545).

Francis introduced new methods into government. In his reign the monarchical authority became more imperious and more absolute. His was the government “du bon plaisir.” By the unusual development he gave to the court he converted the nobility into a brilliant household of dependants. The Concordat brought the clergy into subjection, and enabled him to distribute benefits at his pleasure among the most docile of his courtiers. He governed in the midst of a group of favourites, who formed the conseil des affaires. The states-general did not meet, and the remonstrances of the parlement were scarcely tolerated. By centralizing the financial administration by the creation of the Trésor de l'Épargne, and by developing the military establishments, Francis still further strengthened the royal power. His government had the vices of his foreign policy. It was uncertain, irregular and disorderly. The financial situation was grave and the national credit was endangered, and the treasury was drained by his luxurious habits, by the innumerable gifts and pensions he distributed among his mistresses and courtiers, by his war expenses and by his magnificent buildings. His government, too, weighed heavily upon the people, and the king was less popular than is sometimes imagined.

Francis owes the greater measure of his glory to the artists and men of letters who vied in celebrating his praises. He was pre-eminently the king of the Renaissance. Of a quick and cultivated intelligence, he had a sincere love of letters and art. He held a high place in the history of humanism by the foundation of the Collège du Frère d'histoire, which he did not found an actual college, but after much hesitation instituted in 1530, at the instance of Guillaume Budé (Budaeus), Lecteur royal, who in spite of the opposition of the Sorbonne were granted full liberty to teach Hebrew, Greek, Latin, mathematics, &c. The humanists Budé, Jacques Colin and Pierre Duchâtel were the king’s intimates, and Clément Marot was his favourite poet. Francis sent to Italy for artists and for works of art, but he protected his own countrymen also. Here, too, he showed his customary indolence, wavering between the two schools. At his court he installed Benvenuto Cellini, Francesco Primaticcio and Rosso del Rosso, but in the buildings at Chartres, St Germain, Villers-Cotterets and Fontainebleau the French tradition triumphed over the Italian.

Francis died on the 31st of March 1547, of a disease of the urinary ducts according to some accounts, of syphilis according to others. By his first wife Claude (1524) he had three sons and four daughters: Louise, who died in infancy; Charlotte, who died at the age of eight; Francis (d. 1536); Henry, who came to the throne as Henry II.; Madeleine, who became queen of Scotland; Charles (d. 1545); and Margaret, duchess of Savoy. In 1550 he married Eleanor, the sister of the emperor Charles V.

AUTHORITIES.—For the official acts of the reign, the Catalogue des actes de François Ier, published by the Académie des Sciences morales et politiques (Paris, 1887-1907), is a valuable guide. The Bibliothèque Nationale, the National Archives, &c., contain a mass of unpublished documents. Of the published documents, see N. Castellane, Histoire générale et généalogique de la maison de Bourbon, (Troyes, 1619); G. Ribier, Lettres et mémoires d'estat (Paris, 1666); Lettres de Marguerite d'Angoulême, ed. by F. Genin (Paris, 1841 and 1842); the Correspondence of Castillon and Marillac (ed. by Kaulek, Paris, 1885), of Odet de Fontaines (ed. by Ledeuil, Paris, 1886), of Guillaume Du Bellay (ed. by Tausserat-Radel, Paris, 1900); Captivités du roi François Ier, and Poésies du roi François Ier (both ed. by Champollion-Figeac, Paris, 1847, of doubtful authenticity); Relations des ambassadeurs vénitiens, &c. Of the memoirs and chronicles, see K. Martin-Lavisse, Histoire de la maison de Savoie, vol. iv. (ed. of 1778-1780); Journal de Jean Barillon, ed. by de Vassé, (Paris, 1897-1899); Journal d'un bourgeois de Paris, ed. by Lalanne (Paris, 1854); Chronique du roy François Ier, ed. by Guiffrey (Paris, 1868); Memoirs of the Memoirs of Fleuranges, Montluc, Tavannes, Villelevie, Brantôme and especially Martin du Bellay (coll. Michaud and Poujoulat). Of the innumerable secondary authorities, see especially Paulin Paris, Études sur le règne de François I, (1868), and the less exhaustive works of C. Durand and H. Lemonnier in vol. v. (Paris, 1903-1904) of E. Lavisse’s Histoire de France, which gives a list of the principal secondary authorities. There is a more complete bibliographical study by V. Lambert, in the Dictionnaire critique de la littérature moderne française, vol. iv. (1902-1903). The printed sources have been catalogued by H. Hauser, Les Sources de l’histoire de France, XVIe siècle, tome ii. (Paris, 1907).
chancellor Michel de l'Hôpital, through whose mediation the edict of Romoranin, providing that all cases of heresy should be decided by the bishop, was passed in May 1760, in opposition to a proposal to introduce the Inquisition. At a meeting of the states-general held at Orleans in the December following, the prince of Condé, after being arrested, was condemned to death, and extreme measures were being enacted against the Huguenots; but the deliberations of the Assembly were broken off, and the prince was saved from execution, by the king's somewhat sudden death, on the 5th of the month, from an abscess in the ear.

Principal Authorities.—"Lettres de Catherine de Médicis," edited by Hector de la Ferrière (1880 seq.), and "Nécrologies... relatives au règne de François II." edited by Louis Paris (1841), both in the Collection des documents historiques de la France (1867) should also be consulted for the notice of Francis, duke of Guise, in the Nouvelle Collection des mémoires pour servir à l'Histoire de France, edited by J. F. Michaud and J. J. Fouquet, series i. vol. vi. (1836 seq.). Mémoires de Catherine de Médicis, by François II. (Panthéon littéraire, new ed., 1884). See also Ernest Lavisse, Histoire de France (vol. vi. by J. H. Mariéjol, 1904), which contains a bibliography.

Francis I. (1777-1836), king of the Two Sicilies, was the son of Ferdinand IV. (1.) and Maria Carolina of Austria. He married Clementina, daughter of the emperor Leopold II. of Austria, in 1796, and at her death Isabella, daughter of Charles IV. of Spain. After the Bourbon family fled from Naples to Sicily in 1806, and Lord William Bentinck, the British resident, had established a constitution and deprived Ferdinand IV. of all power, Francis was appointed regent (1812). On the fall of Napoleon his father returned to Naples and suppressed the Sicilian constitution and autonomy, incorporating his two kingdoms into that of the Two Sicilies (1816); Francis then assumed the title of Duke of Calabria. While still heir-apparent, he professed liberal ideas on the outbreak of the revolution of 1820 he accepted the regency apparently in a friendly spirit towards the new constitution. But he was playing a double game and proved to be the accomplice of his father's treachery. On succeeding to the throne in 1825 he cast aside the mask of liberalism and showed himself as reactionary as his father. He took little part in the government, which left him in the hands of favourites and police officials, and lived with his mistresses, surrounded by soldiers, ever in dread of assassination. During his reign the only revolutionary movement was the outbreak on the Cilento (1828), savagely repressed by the marquis Delcarratello, an ex-liberal turned reactionary.

Francis II. (1836-1864), king of the Two Sicilies, son of Ferdinand II. and Maria Cristina of Savoy, was the last of the Bourbon kings of Naples. His education had been much neglected and he proved a man of weak character, greatly influenced by his stepmother Maria Theresa of Austria, by the priests, and by the Comaroli, or reactionary court set. He assumed the title of Duke of Calabria in 1840. After the death of his father (May 1859). As prime minister he appointed Carlo Filangieri, who, realizing the importance of the Franco-Piedmontese victories in Lombardy, advised Francis to accept the alliance with Piedmont proposed by Cavour. On the 7th of June a part of the Swiss Guard mutinied, and while the king mollified them by promising to redress their grievances, General Nunziante collected other troops, who surrounded the mutineers and shot them down. The incident resulted in the disbanding of the whole Swiss Guard, the strongest bulwark of the dynasty. Cavour again proposed an alliance to divide the papal states between Piedmont and Naples, the province of Rome excepted, but Francis rejected an idea which he considered sacrilegious. Filangieri strongly advocated a constitution as the only measure which might save the dynasty, and on the king's refusal he resigned. Meanwhile the revolutionary parties were conspiring for the overthrow of the Bourbon in Calabria and Sicily, and Garibaldi was preparing for a raid in the south. A conspiracy in Sicily was discovered and the plotters punished with brutal severity, but Rosalino Pilo and Francesco Crispi had organized the movement, and when Garibaldi landed at Marsala (May 1860) he conquered the island with astonishing ease. These events at last frightened Francis into granting a constitution, but its promulgation was followed by disorders in Naples and the resignation of ministers, and Liborio Romano became head of the government. The disintegration of the army and navy proceeded apace, and Cavour sent a Piedmontese squadron carrying troops on board to watch events. Garibaldi, who had crossed the straits of Messina, was advancing northwards and was everywhere received by the people as a liberator. Francis, after long hesitations and even an appeal to Garibaldi himself, left Naples (6th of September) with his wife Maria Sophia, the court, the diplomatic corps (the French and English ministers excepted), and went by sea to Gaeta, where a large part of the army was concentrated. The next day Garibaldi entered Naples, was enthusiastically welcomed, and formed a provisional government. King Victor Emmanuel had decided on the invasion of the allied states, and, occupying Romagna and the Marche, entered the Neapolitan kingdom. Garibaldi's troops defeated the Neapolitan royalists on the Voltorno (1st and 2nd of October), while the Piedmontese captured Capua. Only Gaeta, Messina, and Civitella del Tronto still held out, and the siege of the former by the Piedmontese began on the 6th of November 1860. Both Francis and Maria Sophia behaved with great coolness and courage, and even when the French fleet, whose presence had hitherto prevented an attack by sea, was withdrawn, they still resisted; it was not until the 12th of February 1861 that the fortress capitulated. Thus the kingdom of Naples was incorporated in that of Italy, and the royal pair from that time forth led a wandering life in Austria, France and Bavaria. Francis died on the 27th of December 1894 at Arco in Tirol. His widow survived him.

Francis II. was weak-minded, stupid and vacillating, but, although he was a reactionary, he was not a tyrant. His courage and dignity he displayed during his reverses inspired pity and respect. But the fact that he protected brigandage in his former dominions and connived at the most abominable crimes in the name of legitimism greatly diminished the sympathy which was felt for the fallen monarch.

Bibliography.—R. de Cesare, La Fine d'un regno, vol. ii. (Città di Castello, 1900) gives a detailed account of the reign of Francis II., while H. R. Whitehouse's Collapse of the Kingdom of Naples (New York, 1869) may be recommended to English readers; Nisco'sFranci... de... (Parma, 1880) and Nisi's of Naples; Garibaldi; Bixio; Cavour; Italy; Filangieri; &c. (L. V.)

Francis IV. (1777-1846) duke of Modena, was the son of the archduke Ferdinand, Austrian governor of Lombardy, who acquired the duchy of Modena through his wife Marie Beatrice, heiress of the house of Este as well as of many fiefs of the Malaspina, Pio da Carpi, Pico della Mirandola, Cibó, and other families. At the time of the French invasion (1796) Francis was sent to Vienna to be educated, and in 1809 was appointed governor of Galicia. Later he went to Sardinia, where the exiled King Victor Emmanuel I. and his wife Maria Theresa were living in retirement. The latter arranged a marriage between her daughter Marie Beatrice and Francis, but the secret family compact was made whereby if the king and his two aunts of the same family, object to the marriage issue, the Salic law would be changed so that Francis should succeed to the kingdom instead of Charles Albert of Carignano (N. Bianchi, Storia della diplomazia europea in Italia, i. 42-43). On the fall of Napoleon in 1814 Francis received the duchy of Modena, including Massa-Carrara and Lunigiana; his mother's advice was "to be above the law... never to forgive the Republicans of 1796, nor to listen to the complaints of his subjects, whom nothing satisfies; the poorer they are the quieter they are." (Silingardi, "Ciro Menotti," in Rivista europea, Florence, 1880).

The duke was well received at Modena; inordinately ambitious, strong-willed, immensely rich,avaricious but not unintelligent, he soon proved one of the most reactionary despots in Italy.
He still hoped to acquire either Piedmont or some other part of northern Italy, and he was in touch with the Sanfedisti and the Concistoro, reactionaries Catholic associations opposed to the Carbonari, but not always friendly to Austria. Against the Carbonari and other Liberals he issued the severest edicts, and although there was no revolt at Modena in 1821 as in Piedmont and Naples, he immediately instituted judicial proceedings against the supposed conspirators. Some 350 persons were arrested and tortured, 56 being condemned to death (only a few of them were executed) and 373 to imprisonment; a large number, however, escaped, including Antonio Panizzi (afterwards director of the British Museum). The ferocious police official Besini who conducted the trials was afterwards murdered. The duke actually proposed to Prince Metternich, the Austrian chancellor, an agreement whereby the various Italian rulers were to arrest every Liberal in the country on a certain day, but the project fell through owing to opposition from the courts of Florence and Rome. At the congress of Verona Metternich made another attempt to secure the Piedmontese succession for Francis, but without success. The duke became ever more despotic; Modena swarmed with spies and informers, education was hampered, feudalism strengthened; for the duke hoped to consolidate his power by means of the nobility, and the least expansionist members were ar rested or involved arrest and imprisonment. But strange to say, in 1830 we find Francis actually coquetting with revolution. Having lost all hope of acquiring the Piedmontese throne, he entered into negotiations with the French Orleanist party with a view to obtaining its support in his plans for extending his dominions. He was thus brought into touch with Ciro Menotti (1798-1831) and the Modenese Liberals; what the nature of the connexion was still obscure, but it was certainly short-lived and merely served to betray the Carbonari. As soon as Francis learned that a conspiracy was on foot to gain possession of the town, he had Menotti and several other conspirators arrested on the night of the 3rd of February 1831, and sent the famous message to the governor of Reggio: “The conspirators are in my hands; send me the hangman” (there is some doubt as to the authenticity of the actual words). But the revolt broke out in other parts of the duchy and in Romagna, and Francis retired to Mantua with Menotti. A provisional government was formed at Modena which proclaimed that “Italy is one,” but the duke returned a few weeks later with Austrian troops, and resistance was easily quelled. Some of the trials began in March, and others were executed, and hundreds condemned to imprisonment. The population was now officially divided into four classes, viz. “very loyal, loyal, less loyal, and disdainful,” and the reaction became worse than ever, the duke interfering in the minutest details of administration, such as hospitals, schools, and roads. New methods of procedure were introduced to deal with political trials, but the ministerial cabal by which the country was administered intrigued and squabbled to such an extent that it had to be dismissed.

On the 20th of February 1846 Francis died. Although he had many domestic virtues and charming manners, was charitable in times of famine, and was certainly the ablest of the Italian despots, Liberalism was in his eyes the most heinous of crimes, and his reign is one long record of barbarous persecution. (L. V.)

**FRANCIS V. (1619-1853),** duke of Modena, son of Francis IV., succeeded his father in 1846. Although less cruel and also less intelligent than his father, he had an equally high opinion of his own authority. His reign began with disturbances at Fivizzano and Pontremoli, which Tuscany surrendered to him according to treaty but afterwards the latter, on the outbreak of revolution throughout Italy and at Vienna in 1848, other disorders occurred in the duchy, and on the 20th of March he fled with his family to Mantua. A provisional government was formed, and volunteers were raised who fought with the Piedmontese against Austria. But after the Piedmontese defeat Francis returned to Modena, with Austrian assistance, in August and conferred many appointments on Austrian officers. Like his father, he interfered in the minutest details of administration, and instituted proceedings against all who were suspected of Liberalism. Not content with the severity of the judges, he overrode their sentences in favour of harsher punishments. The disturbers of the peace at Carrara were ruthlessly suppressed, and the prisons filled with political prisoners. In 1859 numbers of young Modenese fled across the frontier to join the Piedmontese army, as war with Austria seemed imminent; and after the Austrian defeat at Magenta the duke left Modena to lead his army in person against the Piedmontese, taking with him the contents of the state treasury and many valuable books, pictures, coins, tapestries and furniture from the palace. The events of 1859-1860 made his return impossible; and after a short spell of provisional government the duchy was united to Italy. He retired to Austria, and died at Munich in November 1875.

**FRANCIS OF ASSISI, ST.** (1181 or 1182-1226), founder of the Franciscans (q.v.), was born in 1181 or 1182 at Assisi, one of the independent municipal towns of Umbria. He came from the upper middle class, his father, named Pietro Bernardone, being one of the larger merchants of the city. Bernardone's commercial enterprises made him travel abroad, and it was from the fact that the father was in France at the time of his son's birth that the latter was called Francesco. His education appears to have been of the slightest, even for those days. It is difficult to decide whether words of the early biographers imply that his youth was not free from irregularities; in any case, he was the recognized leader of the young men of the town in their revels; he was, however, always conspicuous for his charity to the poor. When he was twenty (1201) the neighbouring and rival city of Perugia attempted to restore by force of arms the nobles who had been expelled from Assisi by the burghers and the populace, and Francis took part in the battle fought in the plain that lies between the two cities; the men of Assisi were defeated and Francis was among the prisoners. Francis had a year in prison at Perugia, and when peace was made at the end of 1202 he returned to Assisi and recommenced his old life.

Soon a serious and prolonged illness fell upon him, during which he entered into himself and became disconsolate with his way of life. On his recovery he set out on a military expedition, but at the end of the first day's march he fell ill, and had to stay at Spoleto and return to Assisi. This disappointment brought on again the spiritual crisis he had experienced in his illness, and for a considerable time the conflict went on within him. One day he gave a banquet to his friends, and after it they sallied forth with torches, singing through the streets, Francis being crowned with garlands as the king of the revelers; after a time they missed him, and on retracing their steps they found him in a trance or reverie, a permanently altered man. He devoted himself to solitude, prayer and the service of the poor, and before long went on a pilgrimage to Rome. Finding the usual crowd of beggars before St Peter's, he exchanged his clothes with one of them, and experienced an overpowering joy in spending the day begging among the rest. The determining episodes of his life followed. The Franciscans, or Assisi; as he was always called, he met a leper who begged an alms; Francis had always had a special horror of lepers, and turning his face he rode on; but immediately an heroic act of self-sacrifice was wrought in him; returning he alighted, gave the leper all the money he had about him, and kissed his hand. From that day he gave himself up to the service of the lepers and the hospitals. To the confusion of his father and brothers he went about dressed in rags, so that his old companions pelted him with mud.
FRANCIS OF ASSISI

Things soon came to a climax with his father: in consequence of his profuse alms to the poor and to the restoration of the ruined church of St. Damian, his father feared his property would be dissipated, so he took Francis before the bishop of Assisi to have him legally disinherited; but without waiting for the documents to be drawn up, Francis cast off his clothes and gave them back to his father, declaring that now he had better reason to say “Our Father which art in heaven,” and having received a cloak from the bishop, he went off into the woods of Mount Subasio singing a French song; some brigands accosted him and he told them he was the herald of the great king (1206).

The next three years he spent in the neighbourhood of Assisi in abject poverty and want, ministering to the lepers and the outcasts of society. It was now that he began to frequent the ruined little chapel of St Mary of the Angels, known as the Portiuncula, where much of his time was passed in prayer. One day while Mass was being said therein, the words of the Gospel came to Francis as a call: “Everywhere on your road preach and say—The kingdom of God is at hand. Cure the sick, raise the dead, cleanse the lepers, drive out devils. Freely have you received, freely give. Carry neither gold nor silver nor money in your girdles, nor bag, nor scrip, nor sandals, nor staff for the way ahead of his journey” (Matt. 10: 7). He at once felt that this was his vocation, and the next day, layman as he was, he went up to Assisi and began to preach to the poor (1209). Disciples joined him, and when they were twelve in number Francis said: “Let us go to our Mother, the holy Roman Church, and tell the pope what the Lord has begun to do through us, and carry it out with his sanction.” They obtained the sanction of Innocent III., and returning to Assisi they gave themselves up to their life of apostolic preaching and work among the poor.

The character and development of the order are traced in the article FRANCISIANS; here the story of Francis’s own life and the portrayal of his personality will be attempted. To delineate in a few words the character of the Poverello of Assisi is indeed a difficult task. There is such a many-sided richness, such a tenderness, such a poetry, such an originality, such a distinction revealed by the innumerable anecdotes in the memoirs of his disciples, that his personality is brought home to us as one of the most lovable and one of the strongest of men. It is probably true to say that no one has ever set himself so seriously to imitate the life of Christ and to carry out so literally Christ’s work in Christ’s own way. This was the secret of his love of poverty as manifested in the following beautiful prayer which he addressed to our Lord: “Poverty was in the crib and like a faithful guide she kept herself armed in the great combat Thou didst wage for our redemption. During Thy passion she alone did not forsake Thee. Mary Thy Mother stopped at the foot of the Cross, but poverty mounted it with Thee and clasped Thee in her embrace unto the end; and when Thou wast dying of thirst, as a watchful spouse she prepared for Thee the gall. Thou didst expire in the ardour of her embraces, nor did she leave Thee when dead, O Lord Jesus, for she allowed not Thy body to rest elsewhere than in a borrowed grave. O poorest Jesus, the grace I beg of Thee is to bestow on me the treasure of the highest poverty. Grant that the distinctive mark of our Order may be never to possess anything as its own under the sun for the glory of Thy name, and to have no other patrimony than begging” (in the Legenda 3 Soc.). This enthusiastic love of poverty is certainly the keynote of St. Francis’s spirit; and so one of his disciples in an allegorical poem (translated into English by Mary Carmichael, 1901), and Giotto in one of the frescoes at Assisi, celebrated the “holy nuptials of Francis with Lady Poverty.”

Another striking feature of Francis’s character was his constant joyousness; it was a precept in his rule, and one that he enforced strictly, that his friars should be always rejoicing in the Lord. He retained through life his early love of song, and during his last illness he passed much of his time in singing. His love of nature, animate and inanimate, was very keen and manifested itself in ways that appear somewhat naïve. His preaching to the birds is a favourite representation of St. Francis in art. All creatures he called his “brothers” or “sisters”—the chief example is the poem of the “Praises of the Creatures,” wherein “brother Sun,” “sister Moon,” “brother Wind,” and “sister Water” are called on to praise God. In his last illness he was cauterized, and on seeing the burning iron he addressed “brother Fire,” reminding him how he had always loved him and asking him to deal kindly with him. It would be an anachronism to think of Francis as a philanthropist or a “social worker” or a revivalist preacher, though he fulfilled the best functions of all these. Before everything he was an ascetic and a mystic—an ascetic who, though gentle to others, wore out his body by self-denial, so much so that when he came to die he begged pardon of “brother Ass the body” for having unduly ill treated it: a mystic irradiated with the love of God, endowed in an extraordinary degree with the spirit of prayer, and pouring forth his heart by the hour in the tenderest affections to God and our Lord. St Francis was a deacon but not a priest.

From the return of Francis and his eleven companions from Rome to Assisi in 1209 or 1210, their work prospered in a wonderful manner. The effect of their preaching, and their example and their work among the poor, made itself felt throughout Umbria and Rome in a great religious revival. Great numbers came to join the new order which responded so admirably to the needs of the time. In 1212 Francis invested St Clara (q. v.) with the Franciscan habit, and so instituted the “Second Order,” that of the nuns. As the friars became more and more numerous their missionary labours extended wider and wider, spreading first over Italy, and then to other countries. Francis himself set out, probably in 1212, for the Holy Land to preach the Gospel to the Saracens, but he was shipwrecked and had to return. A year or two later he went into Spain to preach to the Moors, but had again to return without accomplishing his object (1215 probably). After another period of preaching in Italy and watching over the development of the order, Francis once again set out for the East (1219). This time he was successful; he made his way to Egypt, where the crusaders were besieging Damietta, got himself taken prisoner and was led before the sultan, to whom he openly preached the Gospel. The sultan sent him back to the Christian camp, and he passed on to the Holy Land. Here he remained until September 1220. During his absence were manifested the beginnings of the troubles in the order that were to attain such a magnitude after his death. The circumstances under which, at the extraordinary general chapter convened by him shortly after his return, he resigned the office of minister-general (September 1220) are explained in the article FRANCISIANS: here, as illustrating the spirit of the man, it is in place to cite the words in which his abdication was couched: “Lord, I give Thee back this family which Thou didst entrust to me. Thou knowest, most sweet Jesus, that I have no more the power and the qualities to continue to take care of it. I entrust it, therefore, to the ministers. Let them be responsible before Thee at the Day of Judgment, if any brother by their negligence, or their bad example, or by a too severe punishment, shall go astray.” These words seem to contain the mere truth: Francis’s peculiar religious genius was probably not adapted for the government of an enormous society spread over the world, as the Friars Minor had now become.

The chief works of the next years were the revision and final redaction of the Rule and the formation or organization of the “Third Order” or “Brothers and Sisters of Penance,” a vast confraternity of lay men and women who tried to carry out, though in a not very extraordinary general chapter, the fundamental principles of Franciscan life (see TERTIARIES).

If for no other reason than the prominent place they hold in art, it would not be right to pass by the Stigmata without a special mention. The story is well known; two years before his death Francis went up Mount Alverno in the Apennines with some of his disciples, and after forty days of fasting and prayer and contemplation, on the morning of the 14th of September 1224 (to use Sabatier’s words), “he had a vision: in the warm rays of the rising sun he discerned suddenly a strange
FRANCIS OF MAYRONE—FRANCIS OF PAOLA

Francis was so exhausted by the sojourn on Mount Alverno that he had to be carried back to Assisi. The remaining months of his life were passed in great bodily weakness and suffering, and he became almost blind. However, he worked on with his wonted cheerfulness and joyousness. At last, on the 3rd of October 1226, he died in the Portiuncula at the age of forty-five. Two years later he was canonized by Gregory IX., whom, as Cardinal Hugolino of Ostia, he had chosen to be the protector of his order.

The works of St Francis consist of the Rule (in two redactions), the Testament, spiritual admonitions, canticles and a few letters. They were first edited by Wadding in 1623. Two critical editions were published in 1904, one by theFranciscans of Quaracchi near Florence, the other (in a longer and a shorter form) by Professor E. Boehmer of Bonn. Sabatier and Goetz (see below) have investigated the authenticity of the several works; and the four lists, while exhibiting slight variations, are in substantial accord. Besides the works, properly so called, there is a considerable amount of traditional matter—anecdotes, sayings, sermons—preserved in the biographies and in the Fiorello. Thomas great deal of this matter is no doubt substantially authentic, but it is not possible to subject it to any critical sifting.

Note on Sources.—The sources for the life of St Francis and early Franciscan history are very numerous, and an immense literature has grown up around them. Any attempt to indicate even a selection of this literature would here be impossible and also futile; for the discovery of new documents has by no means ceased, and the criticism of the materials is still in full progress, nor can it be said that final results have yet emerged from the discussion. Students will find the chief materials in the following collections: Archiv für Literatur und Kirchengeschichte des Mittelalters (ed. by Ehrle and Denifle, 1885, &c.); publications of the Franciscans of Quaracchi (list to be obtained from Herder, Freiburg im Breisgau); and the two series edited by Paul Sabatier, Collection d'études et de documents sur l'histoire religieuse et littéraire du moyen âge (5 vols., published up to 1906) and Opuscules de critique historique (12 fascicules; the cautious and constructive way of following the controversy is by the aid of the "Bulletin Hagiographique" in Analecta Bollandiana. Relatively popular accounts of the most important sources are supplied in the introductory chapters of Sabatier's Vie de S. François and Speculum perfectionis, and Lempp's Prière Élise de Cortone.

Concerning the life of St Francis and the beginnings of the order, the chief documents that come under discussion are: the two byces by Thomas of Celano (1228 and 1248 respectively; with introduction by A. G. Ferrers Howell, 1908), of which the only critical edition is that of Friar Ed. d'Alençon (1906); the so-called Legenda trium sociorum; the Speculum perfectionis, discovered by Paul Sabatier and edited in 1898 (Eng. trans. by Sebastian Evans, Mirr or of Perfection, 1899). Sabatier's theory as to the nature of these documents was, in brief, that the Speculum perfectionis was the first of all the Lives of the saint, written in 1227 by Br. Leo, his favourite and most intimate disciple, and that the Legenda 3 Soc. is what it claims to be—the handiwork of Leo and the two other monks who composed it. These are the most authentic and the only true accounts. Thomas of Celano's Lives being written precisely in opposition to them, in the interests of the majority of the order that favoured mitigations of the Rule especially in the French provinces, it remains a difficult task for the student to reconstruct the Franciscan origins was explored and discussed by a number of scholars; and then the whole ground was reviewed by Professor W. Goetz of Munich in a study entitled Die Quellen zur Geschichte des Bd. 29 (1905) and 30, p. 896. The three most reliable sources are substantially the same as those of Percvan Ortoyt, the Bollandistes, M. Sabatier, an Observant Franciscan, and are the work of Sabatier: the Legenda 3 Soc. is a forgery; the Speculum perfectionis is a compendium made in the 14th century, also in large measure a forgery, but containing a element (not to be precisely determined) derived from Br. Leo; on the other hand, Thomas of Celano's two Lives are free from the "tendencies" ascribed to them by Sabatier, and that of 1248 was written with the collaboration of Leo and the other companions; thus the best sources are those portions of the Speculum that can with certainty be carried back to Br. Leo, and the Lives by Thomas of Celano, especially the second Life. Goetz's criticism of the documents is characterized by exceeding carefulness and sound sense. Of course, it is not without its limits, and that his conclusions are in all respects final; but his investigations show that the time has not yet come when a biography of St Francis could be produced answering to the demands of modern historical criticism. The official life of St Francis is St Bonaventura's Legenda, published in the long series called Opuscula Franciscana (1898); Goetz's estimate of it (op. cit.) is much more favourable than Sabatier's.

Paul Sabatier's fascinating study (1907) of many ways sympathetic Vie de S. François (1906, 1909) has by no means ceased, but is an excellent guide to the materials. Thomas of Celano's work has been examined by E. H. Houghton (1901) who will probably for a long time to come be accepted by the ordinary reader as a substantially correct portrait of St Francis; and yet Goetz declares that the most competent and independent critics have with no exception pronounced that the historian has depicted St Francis too much to the advantage of the order, and that his conception of the saint's life has been too much influenced by the standpoint of modern religiosity, and has exaggerated his attitude in face of the church (op. cit. p. 5). In articles in the Hist. Vierteljahrsschrift (1902, 1903) Goetz has shown that Sabatier's presentation of St Francis as the religious reformer, a rejector of ecclesiastical authority in general, and even with Cardinal Hugolino (Gregory IX.) in particular, is largely based on misconception; that the development of the order was not forced on Francis against his will; and that the differences in the order did not during Francis's lifetime attain to such a magnitude as to cause him during his last years the suffering depicted by Sabatier. This from a Protestant historian like Goetz is most valuable criticism. In truth Sabatier's St Francis is an anarchonism—a man at heart, a modern pietistic French Protestant of the most liberal type, with a vision of 18th century society.

Of lives of St Francis in English may be mentioned those by Mrs Oliphant (2nd ed., 1871) and by Canon Knox Little (1897). For general information and references to the literature of the subject, see the entry by Dr. A. M. Ashke and Münkemüller (1817), in the Biographie universelle, the article by Herzog's Realencyklopädie (ed. 3), "Franz von Assisi" (1899); also Max Heimbucher, Orden und Kongregationen (1896), i. 38. The chapter on St Francis in Emile Gehehr's Italie mystique (ed. 1909) is very remarkable indeed, though this writer is a little ecclesiastically-minded as Sabatier himself, his general picture of the state of religion in Italy at the time is far truer; here also Sabatier has given way to the usual temptation of biographers to exalt their heroes by imaginative depictions. (B. B.)

FRANCIS OF MAYRONE [Franciscus de Mayronis] (d. 1381). Scholastic philosopher, was born at Mayrone in Provence. He entered the Franciscan order and subsequently went to Paris, where he was a pupil of Duns Scotus. At the Sorbonne he acquired a great reputation for ability in discussion, and was known as the Doctor Illuminatus and Magister Acutus. He became a professor of philosophy, and took part in the discussions on the nature of Universals. Following Duns Scotus, he adopted the Platonist theory of ideas, and denied that Aristotle had made any contribution to metaphysical speculation. It is a curious commentary on the theories of Duns Scotus that one pupil, Francis, should have taken this course, while another pupil, Occam, should have used his arguments in a diametrically opposite direction and ended in extreme Nominalism.

His works were collected and published at Venice in 1520 under the title Praeclarissima ac multisubtilis scripta Illuminatus Doctoris Francisci de Mayronis, &c.

FRANCIS OF PAOLA (or Paul), ST., founder of the Minims, a religious order in the Catholic Church, was born of humble
FRANCIS OF SALES

parentage at Paola in Calabria in 1476, or according to the Bollandists 1438. As a boy he entered a Franciscan friary, but left it and went to live as a hermit in a cave on the seashore near Paola. Soon disciples joined him, and with the bishop's approval he built a church and monastery. At first they called themselves "Hermits of St Francis", but the object they proposed to themselves was to go beyond even the strict Franciscans in fasts and bodily austerities of all kinds, in poverty and in humility; and therefore, as the Franciscans were the Minims (minores, less), the new order took the name of Minims (minimi, least). By 1474 a number of houses had been established in southern Italy and Sicily, and the order was recognized and approved by the pope. In 1482 Louis XI. of France, being on his deathbed and hearing the reports of the holiness of Francis, sent him to ask him to come and attend him, and at the pope's command he travelled to Paris. On this occasion Philip de Comines in his Memoirs says: "I never saw any man living so holly, nor out of whose mouth the Holy Ghost did more manifestly speak." He remained with Louis till his death, and Louis' successor, Charles VIII., held him in such high esteem that he kept him in Paris, and enabled him to found various houses of his order in France; in Spain and Germany, too, monasteries were founded during Francis' lifetime. He never left France, and died in 1507 in the monastery of his order at Plessis-lez-Tours.

The Rule was so strict that the popes long hesitated to confirm it in its entirety; not until 1506 was it finally sanctioned. The most special feature is an additional vow to keep a perpetual Lent of the strictest kind, not only fast meat but fish and all animal products--eggs, milk, butter, cheese, dripping--being forbidden, so that the diet was confined to bread, vegetables, fruit and oil, and water was the only drink. Thus in matter of diet the Minims surpassed in austerity all orders in the West, and probably all permanently organized orders in the East. The strongly ascetical spirit of the Minims manifested itself in the title borne by the superiors of the houses—not abbot (father), or prior, or guardian, or minister, or rector, but corrector; and the general superior is the corrector general. Notwithstanding its extreme severity the order prospered. At the death of the founder it had five provinces--Italy, France, Tours, Germany, Spain. Later there were as many as 450 monasteries, and some in missions in India. There never was a Minim house in England or Ireland. Francis ranked as one of the Mendicant orders. In the 16th century there were some twenty monasteries, mostly in Sicily, but one in Rome (S. Andrea delle Fratte), and one in Naples, in Marseilles and in Cracow. There have been Minim nuns (only one convent has survived, till recently at Marseilles) and Minim Tertiaries, in imitation of the Franciscan Tertiaries. The habit of the Minims is black.

See Helyot, Hist. des ordres religieux (1714), vii, c. 65; Max Heimburger, Orden und Kongregatioen (1860), ii. § 52; the article "Francis von Paula" in Wetscher und Welte, Kirchlichen (ed. 2), and in Herzog, Realencyclopaedie (ed. 3); Catholic Dictionary, art. "Minims." (E. C. B.)

FRANCIS (FRANCOIS) OF SALES, ST (1567-1622), bishop of Geneva and doctor of the Church (1877), was born at the castle of Sales, near Annecy, Savoy. His father, also François, comte de Sales, but better known as M. de Boisy, a nobleman and soldier, had been employed in various affairs of state, but in 1560, at the age of thirty-eight, settled down on his ancestral estates and married Françoise de Sionnay, a Savoyard like himself, and an heiress. St Francis, the first child of this union, was born in Paris, France, on 6 August 1567 when his mother was in her twenty-third year. M. de Boisy much esteemed his experience and sound judgment, and both parents were distinguished by piety, love of peace, charity to the poor, qualities which early showed themselves in their eldest son.

He received his education first at La Roche, in the Arve valley, then at the college of Annecy, founded by Eustace Chappier, ambassador in England of Charles V., in 1549. At the age of thirteen or fourteen he went to the Jesuit College of Clermont at Paris, where he stayed till the summer of 1588, and where he laid the foundations of his profound knowledge, while perfecting himself in the exercises of a young nobleman and practising a life of exemplary virtue. After a course of studies designed to develop his ardent love of France, a country which was politically in antagonism with his own, though so closely linked to it geographically, socially and by language. At the end of 1588 he went to Padua, to take his degree in canon and civil law, a necessary prelude in Savoy at that time to distinction in a civil career. His heart, however, especially from the date of his receiving the tonsure (1578), was already turned towards the Church, and he gave his attention even more to theology, under the great masters Antonio Possevino, S.J., and Gesualdo, afterwards general of the Friars Minor, than to his legal course. "At Padua," he said to a friend, "I studied law to please my father, and theology to please myself." In that licentious university Francis found the greatest difficulty in resisting attacks on his virtue, and once at least had to draw his sword to defend his personal safety against a band of ruffians. The gentleness for which he was already renowned was not that of a weak, but of a strong character. He returned to Savoy in 1592, and, while seeking the occasion to overcome his father's resistance to his resolution of embracing the ecclesiastical profession, to the diploma of which he was entitled. Meanwhile, with his learned friends procured for him the post of provost of the chapter of Geneva, an honour which reconciled M. de Boisy to the sacrifice of more ambitious hopes. After a year of zealous work as preacher and director he was sent by the bishop, Claude de Granier, to try and win back the province of Chablais, which, with the blessing of Calvinism when usurped by Bern in 1535, and had retained it even after its restitution to Savoy in 1564. At first the people refused to listen to him, for he was represented to them as an instrument of Satan, and all who had dealings with him were threatened with the vengeance of the consistory. He therefore wrote out his message on sheets which were passed from hand to hand, and these, with the spectacle of his virtues and disinterestedness, soon produced a strong effect. The sheets just spoken of still exist in the Chigi library at Rome, and were published, though with many alterations, in 1672, under the title of Les Controverse. This must be considered the first work of St Francis.

The re-erection of a wayside cross in Annemasse, at the gates of Geneva, amid an enormous concourse of converts, an event which closed the three years of his apostolate, led to the composition of the Défense de la Croix, published in 1600. An illness brought on by toil and privation forced him to leave his work to others for nearly a year, but in August 1598 he returned to his field of labour, and in October of that year practically the whole country was Catholic again. Up to that time preaching and conference had been the only weapons employed. The stories of the use of soldiers to produce simulated conversions are incorrect.1 Possibly the lamentable events of the campaigns of 1589 in Gex and Chablais have been applied to the

1 This, at least, is the account given by Catholic authorities. Less favourable is the view taken by non-Catholic historians, which seems in some measure to be confirmed by St Francis himself. According to this, Duke Charles Emmanuel of Savoy, who succeeded his father, the Duke of Savoy, in 1569, was so actuated by a desire to reconcile the Chablais to the Catholic religion, by peaceful means if possible, by force if necessary. After two years of preaching Francis wrote to the duke (États comts, ii, p. 551): "During 27 months I have scattered the seed of the Word of God in this miserable land; shall I say among thorns or on stony ground? Certainly, save for the conversion of the seigneur d'Avully and the advocate Poncet, I have little to boast of." In the winter of 1596-1597 Francis was at Genoa, and the duke closed a treaty with the Emperor that year for the coercion of the refractory Protestants. This plan anticipated that employed later by Louis XIV. against the Huguenots in France. The Calvinist ministers were expelled; Protestant books were confiscated and destroyed; the acts of Protestant lawyers and notaries were declared invalid; reconciliation between Protestants and Catholics was forbidden; the refractory soldiers were armed and their officers declared to be in league with the Jesuits and friars, whose arguments were reinforced by quartering troops, veterans of the Indian wars in Mexico, on the refractory inhabitants. Those whose stubborn persistence in error survived all these inducements to repent were sent into exile. See the article "Franz von Sales" by J. Ehni in Herzog-Hauck, Realencyclopaedie (3rd ed., Leipzig, 1899).
The period 1594-1658. In October of this last year, however, the duke of Savoy, who came then to assist in person at the great religious feasts which celebrated the return of the country to unity of faith, expatriated such of the leading men as obstinately refused even to listen to the Catholic arguments. He also forbade Calvinist ministers to reside in the Chablais, and substituted Catholic for Huguenot officials. St Francis concurred in these measures, and, three years later, even requested that those who, as he said, “follow their heresy, rather as a party than a religion,” should be ordered either to conform or to leave their country, with leave to sell their goods. His conduct, judged not by a modern standard, but by the ideas of his age, will be found compatible with the highest Christian charity, as that of the duke with sound political prudence. At this time he was nominated to the pope as coadjutor of Geneva,1 and after a visit to Rome assisted Bishop de Granier in the administration of the newly converted countries and of the diocese at large.

In 1602 he made his second visit to the French capital, when his transcendent qualities brought him into the closest relations with the court of Henry IV., and made him the spiritual father of that circle of select souls who centred round Madame Acadie. Among the celebrated personages who became his life friends from this time were Pierre de Bérulle, founder of the French Oratorians, Guillaume Duval, the scholar, and the due de Bellegarde, the latter a special favourite of the king, who begged to be allowed to share the Saint’s friendship. At this time also his gift as a preacher became fully recognized, and de Sanzé, afterwards bishop of Bethlehem, records that Duval exhorted all his students of the Sorbonne to listen to him and to imitate this, “the true and excellent method of preaching.” His principles are expressed in the admirable letter to André Frémoy of October 1604.

De Granier died in September 1602, and the new bishop entered on the administration of his vast diocese, which, as a contemporary says, “he found brick and left marble.” His first efforts were directed to securing a virtuous and well-instructed clergy, with its consequence of a people worthy of their pastors. All his time was spent in preaching, confessing, visiting the sick, relieving the poor. His zeal was not confined to his diocese. In concert with Jeanne Françoise Frémoy de Granier (1572-1641), widow of the baron de Chantal, whose acquaintance he made while preaching through Lent at Dijon in 1604, he founded the order of the Visitations, in favour of “strong souls and weak bodies,” as he said, deterred from entering the orders already existing, by their inability to undertake severe corporal austerities. The institution rapidly spread, counting twenty houses before his death and eighty before that of St Jeanne. The care of his diocese and of his new foundation were not enough for his ardent charity, and in 1600 he published his famous Introduction to a Devout Life, a work which was once translated into the chief European languages and of which he himself published five editions. In 1616 he appeared his Treatise on the Love of God, which teaches that perfection of the spiritual life to which the former work is meant to be the “Introduction.”

The important Lents of 1617 and 1618 at Grenoble were a prelude to a still more important apostolate in Paris, “the theatre of the world,” as St Vincent de Paul calls it. This third visit to the great city lasted from the autumn of 1618 to that of 1619; the direct object of it was to assist in negotiating the marriage of the prince of Piedmont with Chrétienne of France, but nearly all his time was spent in preaching and works of mercy, spiritual or corporal. He was regarded as a living saint. St Vincent scarcely left him, and has given the most extraordinary testimonies (as yet unpublished) of his heroic virtues. Mère Angélique Arnaud, who at this time put herself under his direction and wished to join the Order of the Visitations, attracted by its humility and sweetness, may be named as the most interesting of his innumerable penitents of this period. He returned to Savoy, and after three years more of unwearying labour died at Lyons on the 28th of December 1622. A universal obituary of veneration followed; indeed his cult had already begun, and after 1

1 With the title of Nicopolis in peribus – Ed.
should be eager to take an active part in the discussion, though his position as a government official made it necessary that his intervention should be carefully disguised. He is known to have written to the Public Ledger and Public Advertiser, as an advocate of the popular cause, on many occasions about and after the year 1763; he frequently attended debates in both Houses of Parliament, especially when American questions were being discussed; and between 1769 and 1771 he is also known to have been favourable to the scheme for the overthrow of the Grafton government and afterwards of that of Lord North, and for persuading or forcing Lord Chatham into power. In January 1769 the first of the Letters of Junius appeared, and the series was continued till January 21, 1772. They had been preceded by others under various signatures such as "Candor," "Father of Candor," "Anti-Sejanus," "Lucius," "Nemesia," which have all been attributed, some of them certainly in error, to one and the same hand. The authorship of the Letters of Junius has been assigned to Francis on a variety of grounds (see Junius).

In March 1772 Francis finally left the war office, and in July of the same year he left England for a tour through France, Germany and Italy, which lasted until the following December. On his return he was contemplating emigration to New England, when in June 1773 Lord North, on the recommendation of Lord Barrington, appointed him a member of the newly constituted supreme council of Bengal at a salary of £10,000 per annum. Along with his colleagues Monson and Clavering he reached Calcutta in October 1774, and a long struggle with Warren Hastings, the governor-general, immediately began. These three, actuated probably by petty personal motives, combined to form a majority of the council in harasing opposition to the governor-general's policy; and they even accused him of corruption, mainly on the evidence of Nuncumar. The death of Monson in 1776, and of Clavering in the following year, made Hastings again supreme in the council. But a dispute with Francis, more than usually embittered, led in August 1780 to a minute being delivered to the council board by Hastings, in which he stated that "he judged of the public conduct of Mr Francis by his experience of his private, which he had found to be void of truth and honour." A duel was the consequence, in which Francis received a dangerous wound (see Hastings, Warren). Though his recovery was rapid and complete, he did not choose to prolong his stay abroad. He arrived in England in October 1781, and was received with little favour.

Little is known of the nature of his occupations during the next two years, except that he was uniting in his efforts to procure first the recall, and afterwards the impeachment of his hitherto triumphant adversary. In 1783 Fox produced his India Bill, which led to the overthrow of the coalition government. In 1784 Francis was returned by the borough of Yarmouth, Isle of Wight; and although he took an opportunity to disclaim every feeling of personal animosity towards Hastings, this did not prevent him, on the return of the latter in 1785, from doing all in his power to bring forward and support the charges which ultimately led to the impeachment of Hastings. After the impeachment of 1785, excluded by a majority of the House from the list of the managers of that impeachment, Francis was none the less its most energetic promoter, supplying his friends Burke and Sheridan with all the materials for their eloquent orations and burning invectives. At the general election of 1790 he was returned member for Bletchingley. He sympathized warmly and actively with the French revolutionary doctrines, expostulating with Burke on his vehement denunciation of the same. In 1793 he supported Grey's motion for a return to the old constitutional system of representation, and so earned the title to be regarded as one of the earliest promoters of the cause of parliamentary reform; and he was one of the founders of the Society of the Friends of the People. The acquittal of Hastings in April 1795 disappointed Francis of the governor-generalship, and in 1798 he had to submit to the additional mortification of a defeat in the general election. He was once more successful, however, in 1802, when he sat for Appleby, and it seemed as if the great ambitions of his life were about to be realized when the Whig party came into power in 1806. His disappointment was great when the governor-generalship was, owing to party exigencies, conferred on Sir Gilbert Elliot (Lord Minto); he declined, it is said, soon afterwards the government of the Cape, but accepted a K.C.B. Though re-elected for Appleby in 1806, he failed to secure a seat in the following year; and the remainder of his life was spent in comparative privacy.

Among the later productions of his pen were, besides the Plan of a Reform in the Election of the House of Commons, pamphlets entitled Proceedings in the House of Commons on the Slave Trade (1796), Reflections on the Abundance of Paper in Circulation and the Scarcity of Specie (1810). Historical Questions Exhibited (1818), and a Letter to Earl Grey on the Policy of Great Britain and the Allies towards Norway (1814). His first wife, by whom he had six children, died in 1806, and in 1814 he married his second wife, Emma Watkins, who long survived him, and who left voluminous manuscripts relating to his biography. Francis died on the 23rd of May 1818. In his domestic relations he was exemplary, and he lived on terms of mutual affection with a wide circle of friends. He was, however, full of vindictiveness, dissimulation and treachery, and there can be little doubt that in his historic conflict with Warren Hastings unworthy personal motives played a leading part.

FRANCIS JOSEPH I. (1830— ), emperor of Austria, king of Bohemia, and apostolic king of Hungary, was the eldest son of the archduke Francis Charles, second son of the reigning emperor Francis I., being born on the 18th of August 1830. His mother, the archduchess Sophia, was daughter of Maximilian I., of Austria. She was a woman of great ability and strong character, and during the years which followed the death of the emperor Francis was probably the most influential personage at the Austrian court; for the emperor Ferdinand, who succeeded in 1815, was physically and mentally incapable of performing the duties of his office; as he was childless, Francis Joseph was in the direct line of succession. During the disturbances of 1848, Francis Joseph spent some time in Italy, where, under Radetzky, at the battle of St Lucia, he had his first experience of warfare. At the end of that year, after the rising of Vienna and capture of the city by Windischgrätz, it was clearly desirable that there should be a more vigorous ruler at the head of the empire, and Ferdinand, now that the young archduke was of age, was able to carry out the abdication which he and his wife had long desired. All the preparations were made with the utmost secrecy; on the 2nd of December 1848, in the archiepiscopal palace at Olmütz, with the other court had fled from Vienna, the emperor abdicated. His brother resigned his rights of succession to his son, and Francis Joseph was declared emperor. Ferdinand retired to Prague, where he died in 1875.

The history of the Dual Monarchy during his reign is told under the heading of Austria-Hungary, and here it is only necessary to deal with its personal aspects. The young emperor was during the first years of his reign completely in the hands of Prince Felix Schwarzenberg, to whom, with Windischgrätz and Radetzky, he owed it that Austria had emerged from the revolution apparently stronger than it had been before. The first task was to reduce Hungary to obedience, for the Magyars refused to acknowledge the validity of the abdication in so far as it concerned Hungary, on the ground that such an act would only be valid with the consent of the Hungarian parliament. A further motive for their attitude was that Francis Joseph, unlike his predecessor, had not taken the oath to observe the Hungarian constitution, which it was the avowed object of Schwarzenberg
to overthrow. In the war which followed the emperor himself took part, but he was not brought to a successful conclusion till the help of the Russians had been called in. Hungary, deprived of her ancient constitution, became an integral part of the Austrian empire. The new reign began, therefore, under sinister omens, with the suppression of liberty in Italy, Hungary and Germany. In 1853 a Hungarian named Lebényi attempted to assassinate the emperor, and succeeded in inflicting a serious wound with a knife. With the death of Schwarzenberg in 1852 the personal government of the emperor really began, and with it that long series of experiments of which Austria has been the subject. Generally it may be said that throughout his long reign Francis Joseph remained the real ruler of his dominions; he not only kept in his hands the appointment and dismissal of his ministers, but himself directed their policy, and owing to the great knowledge of affairs, the unremitting diligence and clearness of apprehension, to which all who transacted business with him have borne testimony, he was able to keep a very real control even of the details of government.

The recognition of the separate status of Hungary, and the restoration of the Magyar constitution in 1866, necessarily made some change in his position, and so far as concerns Hungary he颇为 despotic and despotic, since he was responsible to parliament. In the other half of the monarchy (the so-called Cisleithan) this was not possible, and the authority and influence of the emperor were even increased by the contrast with the weaknesses and failures of the parliamentary system. The most noticeable features in his reign were the repeated and sudden changes of policy, which, while they arose from the extreme difficulty of finding any system by which the Habsburg monarchy could be governed, were due also to the personal idiosyncrasies of the emperor. First we have the attempt at the autocratic centralization of the whole monarchy under Bach; the personal influence of the emperor is seen in the conclusion of the Concordat with Rome, by which in 1855 the work of Joseph II was undone and the power of the papacy for a while restored. The foreign policy of this period brought about the complete isolation of Austria, and the "in gratitude" towards Russia, as shown during the period of the Crimean War, which has become proverbial, caused a permanent estrangement between the two great Eastern empires and the imperial families. The system of his father's period was continued for the most part by bringing it to an end, saved the monarchy. After the first defeat Francis Joseph hastened to Italy; he commanded in person at Solferino, and by a meeting with Napoleon arranged the terms of the peace of Villafranca. The next six years, both in home and foreign policy, were marked by great vacillation. In order to meet the universal discontent and the financial difficulties constitutional government was introduced; a parliament was established in which all races of the empire were represented, and in place of centralized despotism was established Liberal centralization under Schmerling and the German Liberals. But the Magyars refused to send representatives to the central parliament; the Slavs, resenting the Germanizing policy of the government, withdrew; and the emperor had really withdrawn his confidence from Schmerling long before the constitution was suspended in 1867 as a first step to a reconciliation with Hungary. In the complicated German affairs the emperor in vain sought for a minister on whose knowledge and advice he could depend. He was guided in turn by the inconsistent advice of Schmerling, Rechberg, Menden; but no room for more obscure counsellors, and it is not surprising that Austria was repeatedly outmatched and outwitted by Prussia. In 1863, at the Fürstenstag in Frankfort, the emperor made an attempt by his personal influence to solve the German question. He invited all the German sovereigns to meet him in conference, and laid before them a plan for the reconstruction of the confederation. The momentary effect was immense; for some of the halo of the Holy Empire still clung round the head of the house of Habsburg, and Francis Joseph was welcomed to the ancient free city with enthusiasm. In spite of this, however, and of the skill with which he presided over the debates, the conference came to nothing owing to the refusal of the king of Prussia to attend.

The German question was settled definitively by the battle of Königgrätz in 1866; and the emperor Francis Joseph, with characteristic Habsburg opportunism, was quick to accommodate himself to the new circumstances. Above all, he recognized the necessity for reconciling the Magyars to the monarchy; for it was their discontent that had mainly contributed to the collapse of the Austrian power. He had already, in 1859, as the result of a visit to Budapest, made certain modifications in the Bach system by way of concession to Magyar sentiment, and in 1861 he had had an interview with Déak, during which, though unconvinced by that statesman's arguments, he had at least assured himself of his loyalty. He now made Beust, Bismarck's Saxon antagonist, the head of his government, as the result of whose negotiations with Déak the Austro-Hungarian Compromise of 1867 was agreed upon. A law was passed by the Hungarian diet regularizing the abdication of Ferdinand; at the beginning of June Francis Joseph signed the inaugural diploma and took the oath in Magyar to observe the constitution; on the 8th he was solemnly crowned king of Hungary. The traditional coronation gift of 100,000 florins he assigned to the widows and orphans of those who had fallen in the war against Austria in 1849.

Once having accepted the principle of constitutional government, the emperor-king adhered to it loyally, in spite of the discouragement caused by party struggles embittered by racial antagonisms. If in the Cisleithan half of the monarchy parliamentary government broke down, this was through no fault of the emperor, who worked hard to find a modus vivendi between the factions, and did not shrink from introducing manhood suffrage in the attempt to establish a stable parliamentary system. This expedient, indeed, probably also conveyed a veiled threat to the Magyar chauvinists, who, discontented with the restrictions placed upon Hungarian independence under the Compromise, were agitating for the complete separation of Austria and Hungary under a personal union only; for universal suffrage in Hungary would mean the subordination of the Magyar minority to the hitherto subject races. For nearly forty years after the acceptance of the Compromise the attitude of the emperor-king towards the Magyar constitution had been scrupulously. The agitation for the completely separate organization of the Hungarian army, and for the substitution of Magyar for German in words of command in Hungarian regiments, broke down the patience of the emperor, tenacious of his prerogative as supreme "war lord" of the common army. A Hungarian deportation which came to Vienna in September 1905 to urge the Magyar claims was received ungraciously by the emperor, who did not offer his hand to the members, addressed them in German, and referred them brusquely to the chancellor, Count Goluchowski. This incident caused a considerable sensation, and was the prelude to a long crisis in Hungarian affairs, during which the emperor-king, while quick to repair the unfortunate impression produced by his momentary pique, held inflexibly to his resolve in the matter of the common army.

In his relations with the Slavs the emperor displayed the same conciliatory disposition as in the case of the Magyars; but though he more than once held out hopes that he would be crowned at Prague as king of Bohemia, the project was always abandoned. In this, indeed, as in other cases, it may be said that the emperor was guided by practical motives rather than by a common-sense appreciation of the needs and possibilities of the moment. Whatever his natural prejudices or natural resentments, he never allowed these to influence his policy. The German empire and the Italian kingdom had been built up out of the ruins of immemorial Habsburg ambitions; yet he refused to be drawn into an alliance with France in 1869 and 1870, and became the mainstay of the Triple Alliance of Austria-Hungary, Germany and Italy. His reputation as a consistent moderating influence in European policy and one of the chief guarantors of European peace was indeed rudely shaken in October 1908, the year in which he celebrated his
FRANCIS JOSEPH I. OF AUSTRIA

sixty years' jubilee as emperor, by the issue of the imperial rescript annexing Bosnia and Herzegovina to the Habsburg dominions, in violation of the terms of the treaty of Berlin. But his opportunism was again justified by the result. Europe lost an ideal; but Austria gained two provinces.

In his private life the emperor was the victim of terrible catastrophes—his wife, his brother and his only son having been destroyed by sudden and violent deaths. He married in 1854 Elizabeth, daughter of Maximilian Joseph, duke of Bavaria, who belonged to the younger and non-royal branch of the house of Wittelsbach. The empress, who shared the remarkable beauty common to all her family, took little part in the public life of Austria. After the first years of married life she was seldom seen in Vienna, and spent much of her time in travelling. She built a castle of great beauty and magnificence, called the Achilleion, in the island of Corfu, where she often resided. In 1867 she accompanied the emperor to Budapest, and took much interest in the reconciliation with the Magyars. She became a good Hungarian scholar, and spent much time in Hungary. An admirable horsewoman, in later years she repeatedly visited England and Ireland for the hunting season. In 1897 she was assassinated at Geneva by an Italian anarchist; previous attempts had been made on her and on her husband during a visit to Trieste.

There was one son of the marriage, the crown prince Rudolph (1857–1889). A man of much ability and promise, he was a good linguist, and showed great interest in natural history. He published two works, Fifteen Days on the Danube and A Journey in the East, and also promoted the publication of an important illustrated work giving a full description of the whole Austro-Hungarian monarchy; he personally shared the labours of the editorial work. In 1881 he married Stéphanie, daughter of the king of the Belgians. On 30th January 1889 he committed suicide at Mayerling, a country house near Vienna. He left one daughter, Elizabeth, who was betrothed to Count Alfred Windischgrätz in 1901. In 1900 his widow, the crown princess Stéphanie, married Count Lonyay; by this she sacrificed her rank and position within the Austrian monarchy. Besides the crown prince the empress gave birth to three daughters, of whom two survive: Gisela (born 1857), who married a son of the prince regent of Bavaria; and Marie Valerie (born 1868), who married the archduke Franz Salvador of Tuscany.
